Introduction to OpenAir XML API

OpenAir provides OpenAir XML API as a layer for the exchange of OpenAir data between the main site and peripheral programs. These programs include partnered Web sites, OpenAir in-house applications that do not need direct database access, and third party applications indirectly supported through OpenAir. Before you begin using this service, we recommend that you review Appendix D Best Practices.

The application programming interface (API) is data-centric, but it is not a direct line into the OpenAir database. While it provides access to much of the information on OpenAir, it is a layer of indirection from the actual database structure. OpenAir's database structure may change, but applications that use the API will not need to change.

Technology

OpenAir XML API is based on industry standard components: HTTPS (Secure Hypertext Transfer Protocol) and XML (Extensible Markup Language).

<table>
<thead>
<tr>
<th>Standard Name</th>
<th>Web Site Reference</th>
</tr>
</thead>
<tbody>
<tr>
<td>RFC2660 The Secure HyperText Transfer Protocol</td>
<td><a href="http://rfc.net/rfc2660.html">http://rfc.net/rfc2660.html</a></td>
</tr>
<tr>
<td>Extensible Markup Language (XML) 1.0 (Fourth Edition)</td>
<td><a href="http://www.w3.org/TR/xml/">http://www.w3.org/TR/xml/</a></td>
</tr>
</tbody>
</table>

Much of the work in implementing an API-aware client can be done using off-the-shelf parts. HTTPS is used for the transport layer, providing an easy avenue to encrypt transactions. XML is used both for the command syntax (asking for information) and for the actual data content (packaging the requested information). The HTTPS request is presented in a PUT or POST request, and the response is the resulting document.

XML is essentially a subset of SGML (Standard Generalized Markup Language) and, unlike HTML, has the advantage of being able to handle user-defined tags. XML has a context-dependent, nested structure. XML tags provide a context for the data contained within each of them. This allows you to send meaningful information easily and quickly over the World Wide Web. XML is particularly suited to the transfer of data to and from databases. For the information to be useful, it must be properly identified.

Since the OpenAir services are database-driven, it is important that the information you collect from your users is compatible with the fields in the database. We provide you with the list of XML commands and datatypes that are meaningful to an OpenAir database. Through the use of commands and datatypes provided by the API and by limiting the values that can be stored in each datatype, your data will always be consistent with, and able to be stored within, an OpenAir database.

Target Audience

This document is intended for developers of applications that will connect to the OpenAir Web site.

Overview

- **Namespaces and Connecting to the API** — addresses how to access namespaces and shows you how to connect to the OpenAir API.
- **XML Commands** — lists XML commands for each possible method. Provides associated code, results returned, and additional information and examples.
- **Custom Fields** — introduces custom fields and provides information for requesting custom fields for a datatype, reading custom field values, and modifying records to set custom field values.
- **XML Datatypes** — provides the OpenAir XML Datatypes with a description of the structure and substructure.
- **Setting Application Switches Via the API** — describes Company and User switches you can set using the API.
- **Customizing the Application** — describes the options available for customizing OpenAir.
- **Other Features** — lists ways of limiting records returned through the use of filters and IDs. Also describes how to add hints to the application.
- **Code Examples** — provides code examples for connecting to the server, receiving information, and creating a user account.
- **Appendix A - Error Code Listing** — identifies common errors and associated codes.
- **Appendix B - A Simple Client** — provides a simple client example to demonstrate exchanges to and from the API server.
- **Appendix C - OpenAir Data Dictionary** — explains database fields and how they relate to datatypes using the Customer table as an example. For more data dictionary information, refer to OpenAir Data Dictionary.
- **Appendix D - Best Practices** — provides a guide for preparing for and using the API.

### Definitions

- **XML**: eXtensible Markup Language
- **API**: Application Program Interface
- **Server**: The OpenAir site that understands the API
- **Client**: Application that talks to Server using the API
- **XML structure**: An XML element that contains other XML elements
- **OA**: Abbreviation for OpenAir

### Presentation of XML

Although the XML actually used in the application does not contain any new lines or formatting, it is presented in an easier-to-read indented style in this document. Refer to the following example.

```xml
<First_level>
  <Second_level>
    <Third_level/>
    <Third_level>X</Third_level>
  </Second_level>
</First_level>
```

Throughout this document, elements are referred to as first-level, second-level, third-level, etc. This corresponds to how deeply the elements are nested in the XML as shown in the previous example.

### Authorization and Command Overview

All requests to the API take this general form:
Authorization and Command Overview

- Authorization (login/pass)
- Ask (for data)
- Answer (with data)

Each of these requests consists of at least one command, and usually some data. The 'auth' and 'ask' portions are in an HTTP PUT or POST request to the server, the 'answer' is the resulting document returned from the request. Since we are using HTTP, each connection is isolated, and must go through authorization each time. This authorization consists of sending the server an XML data structure consisting of company name, user name, and user password. This is the same data users must enter to use the OA site proper.

The Ask portion of the interaction can contain zero-to-many commands (although zero isn't very useful). These commands are used to get updated information, to update information on the server, or even just to ask for the time. The basic commands are Read, Modify, Add, and Delete. Each of these can be applied to any of the XML structure types. Refer to XML Datatypes for more information. Most commands only serve one function, but Read has several methods including 'newer than' and 'equal to'. Refer to XML Commands for more information.

The Answer portion of the exchange contains success/failure status for all commands in the Ask portion, and data for any of the commands that had success. The data is returned in the same order it was asked for, separated out by the Ask command that generated the data.

Naming Conventions for Objects and Commands

XML is used for both the command syntax and the data exchanged. The basic layout for a request is as follows:

```xml
<request>
  <Command1>
    <Data>
  </Command1>
  <Command2>
    <Data>
  </Command2>
  <Command3>
    <Data>
  </Command3>
  ...
  <CommandN>
    <Data>
  </CommandN>
</request>
```

The server response looks similar:

```xml
<response>
  <Command1 status="0">
    <Data>
  </Command1>
  <Command2 status="0">
    <Data>
  </Command2>
  ...
</response>
```
The request element is a first level element, the second level elements are commands, and the third level elements are data.

To make it more readable when there isn't any pretty indentation, the naming structure of the XML commands and data is:

1. request, the basic wrapper for all transactions, never capitalized.
2. Command, the second level element, always capitalized.
3. Data, XML structures are always capitalized. They represent a package or group of data (e.g., address or person). The elements they contained in that structure are all lower case.

In the following example, "Neighbor" contains the elements "name" and "billing_address", which are both lower case. "name" contains a simple string, "billing_address" contains an "Address" XML structure.

Error Handling

Errors are returned via the “status” attribute of command responses. All errors are numbered. For an error code listing, refer to Appendix A Error Code Listing. If the status is success or "0", then for most operations the server will return data. The exception is delete operations. In these cases the server just responds with success or failure.

Errors are also a valid datatype in the XML data set. Instead of looking up an error in the Appendix, you could use the API to query the text translation. Of course, this only works if the problem isn't that requests from the client were badly formed.

If the server encounters badly-formed XML or an incomplete request, it responds with something generic such as:

<response status="1">Badly formed XML, parsing aborted</response>
Connecting to the API

This chapter addresses namespaces and shows you how to connect to the API.

Namespaces

Contact the OpenAir Support Department or your account representative to request API access. See Troubleshooting for instructions. When access is granted, you will receive an API namespace and an API key. These are the two pieces of information required for API access in addition to your regular OpenAir login credentials.

The namespace and key attributes are used to verify that the request is coming from a valid partner that has permission to use our API. You will not be able to access an account with just the namespace and the key. You will also need to know the Company ID, User ID, and Password of the account.

Namespaces, which are used to group accounts on the OpenAir system, can be used for multiple accounts. A Company ID, however, is unique within a namespace. There will never be two identical Company IDs within the same namespace.

Connecting to the API

The request/response of the API is done through an HTTP(S) PUT or POST request to the API server. There are many libraries that support one or both of these types. (Internally they are almost identical). The URL that you send the POST/PUT to is based on the domain for your OpenAir account and is constructed as follows:

https://<account domain>/api.pl

**Important:** The domain for your OpenAir account is the first part of the URL visible in the address bar of your browser after you log into the OpenAir web application.

- If the Use account specific domain feature is enabled on your account and/or if your account has been migrated to Oracle Cloud Infrastructure (OCI), the domain is unique to your account.
  - Typically your account domain will be *.app.openair.com for a Production account, or *.app.sandbox.openair.com for a Sandbox account, where the first part (noted *) is based on your Company ID name.
  - For example, if your Company ID is 'Acme Corp', your domain name would be acme-corp.app.openair.com for Production and acme-corp.app.sandbox.openair.com for Sandbox.
  - See the Release Notes for the October 12, 2019 OpenAir release under Service Changes Impacting infrastructure for more information.
- Otherwise, use the generic domain name www.openair.com for Production or sandbox.openair.com if you are testing the integration on a Sandbox account.

The content that you POST/PUT to the server is your formatted request. The resulting document is the API server’s response.

We highly recommend that you use secure communications for all integrations by connecting over TLS (HTTPS).

XSD schema files can be downloaded from the Administration page within OpenAir.
To export the XSD schema files:

1. Go to Administration Global Settings > Account and click Integration: Import/Export.
2. In the Import/Export screen, click the XSD schema files link. OpenAir will create a ZIP file containing the generated data.
3. Click the Click here link to download the ZIP file with your data.

Initial API Request

The initial request to the API server should include the following attributes:

- XML header: <?xml version="1.0" encoding="UTF-8" standalone="yes"?>
- API_version: (this will be "1.0")
- client: the type of client you are using to connect to the API
- client_ver: the version number of the client
- namespace: the namespace assigned to you by OpenAir (typically "default")
- key: the authentication key used with the namespace

For example, a request for the time on the server could look like this:

```xml
<?xml version="1.0" encoding="UTF-8" standalone="yes"?>
<request API_version="1.0" client="test app" client_ver="1.1" namespace="default" key="0123456789">
  <Time/>
</request>
```

Limits

Currently there are four types of usage limits that are enforced in the OpenAir XML API.

- There is a limit of 1000 records that can be requested at one time. Each request with the "Read" command must contain the "limit" attribute to limit the amount of records being returned. If Read is used without the "limit" attribute, an error will be returned. The "limit" attribute also allows you to request records in batches. See the limit attribute in Attributes for more information.
- There is a limit of 1000 objects any method can accept, so if you need to use add, modify, createUser, or submit methods, make sure to load the records in batches. The server will return an error if more objects are specified.
- There is a frequency limit of daily transactions allowed for each account.
- There is a frequency limit of transactions allowed for each 60-second interval for each account.

OpenAir will send a warning email when you are approaching your API limits.

Managing Your Account Frequency Limits

There are several ways you can track your usage limits in OpenAir:
Use the Remaining Limit command. This command gives you the status of your 24-hour limit. Insert this command at various times during your integrations to see where you are sending the highest volume of requests.

Contact OpenAir Support and request the Enable web services log report feature. This feature creates a report called "Web services — Web services logs" which you can set up to show every API request made after the feature was enabled. You can find this report by navigating to Reports > Detail > Web services > Web services logs or by searching for "Web services logs" in the Report Management interface. Reviewing this report can help identify areas of potential usage limit overages.

- Each row in the Web services log represents one request and response pair.
- Records in the Web services log are only available for seven days after they are created.

Go to Administration > Global Settings > API Limits to view the API request limits that are currently set for your account and the number of requests remaining within the current 24-hour window.

After a frequency limit is reached for either daily transactions or a 60-second interval, our web servers will respond with a 556 error code to the login operation until the end of the period. The best way to avoid breaching these limits is to make sure all records and fields are requested by batching many commands into one request call. Also, avoid making any requests within a loop. See Appendix D Best Practices.

Please contact OpenAir Support (see Troubleshooting) with any further questions about frequency limits. Please note that as each customer’s integration designs and needs vary, OpenAir cannot make specific recommendations to reduce your API requests. Please work with your company’s integration team, follow the best practices in this guide and use the tools described here to see where you can make improvements.

If you require further assistance, you can contact your Account Manager and ask about a Professional Services engagement to help you reduce your API requests.

Internationalization and Character Sets

OpenAir uses UTF-8 encoding to store and display characters in our application. Please ensure that you specify `<xml version="1.0" encoding="UTF-8" standalone="yes"/>` at the start of your XML API request to ensure any non-English characters are transmitted and stored properly.
XML Commands

The following are XML commands with supported methods. Click on the command to review the associated code, results returned, and additional information and examples.

<table>
<thead>
<tr>
<th>Method</th>
<th>Result</th>
</tr>
</thead>
<tbody>
<tr>
<td>Time</td>
<td>Report, CreateUser</td>
</tr>
<tr>
<td>Read</td>
<td>Add, Auth</td>
</tr>
<tr>
<td>Read, all</td>
<td>Delete (id), RemoteAuth</td>
</tr>
<tr>
<td>Read, equal to</td>
<td>Modify (id), MakeURL</td>
</tr>
<tr>
<td>Read, not equal to</td>
<td>Modify (Logo)</td>
</tr>
<tr>
<td>Read, custom equal to</td>
<td>Modify, custom equal to</td>
</tr>
<tr>
<td>Read, user</td>
<td>Submit, Approve</td>
</tr>
<tr>
<td>Read, project</td>
<td>CreateAccount, Reject</td>
</tr>
<tr>
<td>Unapprove</td>
<td>ModifyOnCondition</td>
</tr>
</tbody>
</table>

In the examples provided, datatype is any XML Datatype that contains an id element. Refer to XML Datatypes for field names and definitions as well as a list of supported commands for each datatype.

**Time**

The Time command returns the current time on our servers.

```xml
<Time/>
```

Returned: A Date record of the current server time.

**Read**

Use the read command to retrieve data from OpenAir. Use a variety of methods, fields, and attributes to gather the information you need. Each is described as follows.

**Methods**

Use one of the following methods.

<table>
<thead>
<tr>
<th>Method</th>
<th>Result</th>
</tr>
</thead>
<tbody>
<tr>
<td>all</td>
<td>Returns all records. Use this cautiously as too many records may be requested for the server or client to handle.</td>
</tr>
<tr>
<td>equal to</td>
<td>Returns records that are equal to the field value(s) passed in for the datatype specified.</td>
</tr>
</tbody>
</table>
### Method

<table>
<thead>
<tr>
<th>Method</th>
<th>Result</th>
</tr>
</thead>
<tbody>
<tr>
<td>not equal to</td>
<td>Returns records that are not equal to the field value(s) passed in.</td>
</tr>
<tr>
<td>custom equal to</td>
<td>Allows one to read custom field values for a particular record.</td>
</tr>
<tr>
<td>user</td>
<td>Returns records for the specified user</td>
</tr>
<tr>
<td>project</td>
<td>Returns records for the specified project</td>
</tr>
<tr>
<td>not exported</td>
<td>Returns records not-yet exported</td>
</tr>
<tr>
<td>order</td>
<td>Use to specify a valid column to order by. The default order is ascending. For example:</td>
</tr>
<tr>
<td></td>
<td>//Get the 10 newest objects in descending order</td>
</tr>
<tr>
<td></td>
<td>order=&quot;created,desc&quot; limit=&quot;10&quot;</td>
</tr>
<tr>
<td></td>
<td>//Get the latest 10 updated objects in ascending order:</td>
</tr>
<tr>
<td></td>
<td>order=&quot;updated,asc&quot; limit=&quot;10&quot;</td>
</tr>
<tr>
<td></td>
<td>//You can omit the &quot;asc&quot; parameter, as ascending order is the default:</td>
</tr>
<tr>
<td></td>
<td>order=&quot;updated&quot; limit=&quot;10&quot;</td>
</tr>
</tbody>
</table>

### Fields

The Read command response includes all fields for each record returned, by default. Insert the following syntax before </Read> to restrict the fields returned to specific fields.

```xml
<Return>
  <first_field/>
  <second_field/>
  <third_field/>
</Return>
```

### Attributes

Use one of the following attributes.

<table>
<thead>
<tr>
<th>Attribute Name</th>
<th>Value</th>
<th>Result</th>
</tr>
</thead>
<tbody>
<tr>
<td>limit</td>
<td>'1000' or '0, 1000'</td>
<td>Restricts the number of records returned.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Single number value: &quot;1&quot;, &quot;500&quot;, &quot;1000&quot; - simply restricts the number of records returned.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Double number value: &quot;0, 1000&quot; - the first integer specifies the offset of the first record to return and the second integer limits the number of records to return.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>To request data in consecutive batches, only the first part of the limit attribute should be incremented - &quot;0,1000&quot;, &quot;1000,1000&quot;, &quot;2000,1000&quot;, etc.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Sequence requests should be submitted until the result comes back empty or has less items than 1000.</td>
</tr>
<tr>
<td>deleted</td>
<td>1</td>
<td>Returns deleted records. It can be used together with newer-than filter.</td>
</tr>
<tr>
<td>exclude_flags</td>
<td>1</td>
<td>Excludes account or user switches.</td>
</tr>
<tr>
<td>Attribute Name</td>
<td>Value</td>
<td>Result</td>
</tr>
<tr>
<td>------------------------</td>
<td>-------</td>
<td>------------------------------------------------------------------------</td>
</tr>
<tr>
<td>include_nondeleted</td>
<td>1</td>
<td>Returns all records, deleted and nondeleted.</td>
</tr>
<tr>
<td>Note:</td>
<td></td>
<td>This attribute only works in conjunction with the &quot;equal to&quot; method.</td>
</tr>
<tr>
<td>with_project_only</td>
<td>1</td>
<td>Used only with type: Customer. Will only return customers which have</td>
</tr>
<tr>
<td></td>
<td></td>
<td>associated project records.</td>
</tr>
<tr>
<td>base_currency</td>
<td>3</td>
<td>Letter currency code. Works with type: Currencyrate. Converts values</td>
</tr>
<tr>
<td></td>
<td></td>
<td>on the fly to currency specified.</td>
</tr>
<tr>
<td>generic</td>
<td>1</td>
<td>Returns generic resources (users) only, where by default the API</td>
</tr>
<tr>
<td></td>
<td></td>
<td>returns regular users only.</td>
</tr>
<tr>
<td>enable_custom</td>
<td>1</td>
<td>Custom fields to be included inline with other native fields</td>
</tr>
<tr>
<td>calculate_hours</td>
<td>'0' or '1'</td>
<td>Used only with type: Timesheet. When set to '1', returns the Minimum</td>
</tr>
<tr>
<td></td>
<td></td>
<td>number of hours required on the timesheet and the Maximum number of</td>
</tr>
<tr>
<td></td>
<td></td>
<td>hours allowed on the timesheet as set in Administration &gt; Application</td>
</tr>
<tr>
<td></td>
<td></td>
<td>settings &gt; Timesheet Settings &gt; Timesheet rules. See type: Timesheet.</td>
</tr>
<tr>
<td>filter</td>
<td>Comma-separated list of filter values. Possible values are listed below:</td>
<td>Returns only records that follow one or more specified filter criteria.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Using the Date datatype in the objects collection to specify the date</td>
</tr>
<tr>
<td></td>
<td></td>
<td>for date filters.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>By default, date filters compare the updated field to the date</td>
</tr>
<tr>
<td></td>
<td></td>
<td>specified. Use the field attribute to compare any date fields other</td>
</tr>
<tr>
<td></td>
<td></td>
<td>than updated.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>For multiple filters, use a single filter attribute and a comma-separated list of filter values. E.g. set filter=&quot;newer-than,older-than,approved-timesheets&quot; to return all timesheet entries in a certain date range for approved timesheets only.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Important: Make sure there are no spaces between the commas and the</td>
</tr>
<tr>
<td></td>
<td></td>
<td>filter values.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>For multiple date filters, specify date arguments in the objects</td>
</tr>
<tr>
<td></td>
<td></td>
<td>collection in the same order as the filters those arguments apply to.</td>
</tr>
<tr>
<td></td>
<td></td>

<td><strong>Date filter.</strong> Returns only records that have a value in the updated field (or in the field specified using the field attribute) that is not equal to the date specified.</td>
<td></td>
</tr>
</tbody>
</table>

| field                          | **Comma-separated list of date fields** | Use in conjunction with the filter attribute to set date filters and compare any date fields other than updated. Use a comma-separated list to specify the date fields for multiple date filters in the same order as the filters those fields apply to. |

**Read Examples**

Refer to the following Read examples using different methods, fields, attributes, and filters. They include:

- Read, all
- Read, equal to
- Read, not equal to
- Read, custom equal to
- Read, user
- Read, project
- Read, not exported
Read, all

Example 1

The Read, all command returns all records for the datatype specified.

```
<Read type="datatype" method="all" limit="1000"/>
```

Returned: A list containing all XML objects of the datatype you specified.

Use “Read, all” cautiously as too many records may be requested for the server or client to handle. It is better to define types, methods, fields, and attributes to limit the results that are returned. Limit attribute is required for all read requests, where maximum allowed limit is 1000. Refer to the following for more information.

Example 2

To return all tickets that are in open envelopes:

```
<Read type="Ticket" method="all" filter="open-envelopes" limit="1000"/>
```

Example 3

To request timesheet entries whose date field is within a specific one month range, filter by newer-than and older-than. Note that "limit" attribute is required as illustrated in Example 6.

```
<Read type="Task" filter="newer-than,older-than" field="date,date" method="all" limit="1000">
    <Date>
        <year>2011</year>
        <month>07</month>
        <day>01</day>
    </Date>
    <Date>
        <year>2011</year>
        <month>08</month>
        <day>01</day>
    </Date>
</Read>
```

**Note:** The only `<Read/>` method that is supported by the Filter datatype is "Read, all".

Read, equal to

Example 1

The Read, equal to command returns records equal to the value passed in for the datatype specified.
<Read type="datatype" method="equal to" limit="500">
   (One object of type 'datatype' goes here.)
</Read>

Returned: An object of the datatype with the field specified equal to the value passed in, or failed status if that record does not exist.

**Note:** As with the "Read, all" command:
- Using the CustomerProspect datatype returns both customer and prospect records, whereas if you use the Customer datatype, it only returns customer records.
- Inserting `<Return><field> </Return>` syntax before `</Read>` restricts the number of fields within records returned.
- Return only deleted fields by specifying that the attribute = "1"

**Example 2**

To get all records with certain fields having a specific value, add the datatype to the request with the desired values specified on the properties. For example, return all Project records whose owner is user with internal ID 123 and that have tax location ID = 5.

```xml
<Read type="project" method="equal to" limit="1">
   <Project>
      <userid>123</userid>
      <tax_locationid>5</tax_locationid>
   </Project>
</Read>
```

**Example 3**

To get all records with certain fields set to null, add the datatype to the read request with the desired property with no value provided. For example, return all Task records that have slip ID set to NULL and customer internal ID 5.

```xml
<Read type="Task" method="equal to" limit="1000">
   <Task>
      <slipid/>
      <customerid>5</customerid>
   </Task>
</Read>
```

**Example 4**

To return a list of all approved envelopes pending reimbursement:

```xml
<Read type="Envelope" method="equal to" filter="nonreimbursed-envelopes" limit="1000">
   <Envelope>
      <status>A</status>
   </Envelope>
</Read>
```
Example 5

To return a list of time entries that have date value newer than the specified date and are logged against project with id 13, use the following syntax:

```xml
<Read type="Task" method="equal to" filter="newer-than" field="date" limit="1000">
  <Date>
    <year>2012</year>
    <month>03</month>
    <day>25</day>
    <hour>11</hour>
    <minute>01</minute>
    <second>36</second>
  </Date>
  <Task>
    <projectid>13</projectid>
  </Task>
</Read>
```

Example 6

To restrict the number of fields within records returned, filter by field. Insert `<Return>` before `</Read>`. You can return only deleted fields by specifying that the attribute = "1".

```xml
<Read type="Slip" limit="1000" method="equal to">
  <Slip>
    <customerid>1</customerid>
    <projectid>1</projectid>
  </Slip>
  <Return>
    <customerid/>
    <id/>
    <projectid/>
  </Return>
</Read>
```

Returned: slips in customerid, id, and projectid fields. Return 1000 records starting with index 0.

Example 7

To get all records with custom fields having a specific value, add the datatype to the request with the desired values specified on the properties. For example, return all Project records where myCustomField is equal to "756" and that have tax location ID = 5.

```xml
<Read type="Project" enable_custom="1" method="equal to" limit="1">
  <Project>
    <myCustomField__c>756</myCustomField__c>
    <tax_locationid>5</tax_locationid>
  </Project>
</Read>
```
Example 8

To request a currency rate for a base currency to a second currency, for a specified day, with a specified precision, use the Currencyrate complex type with the Read, equal to command. This example uses U.S. dollars as the base currency, Euros as the second currency, September 1, 2016 as the specified day, and 10 as the specified precision.

```xml
<Read type="Currencyrate" method="equal to" limit="1000" filter="date-equal-to" field="date" base_currency="USD" precision="10">
  <Currencyrate>
    <csymbol>EUR</csymbol>
  </Currencyrate>
  <Date>
    <year>2016</year>
    <month>09</month>
    <day>01</day>
  </Date>
</Read>
```

Read, not equal to

Example 1

The Read, not equal to command returns records not equal to the value passed in for the datatype specified.

```xml
<Read type="datatype" method="not equal to" limit="500">
  (One object of type 'datatype' goes here.)
</Read>
```

**Note:** As with the "Read, all" command:

- Using the CustomerProspect datatype returns both customer and prospect records, whereas if you use the Customer datatype, it only returns customer records.
- Inserting `<_Return><field> </_Return>` syntax before `</Read>` restricts the number of fields within records returned.
- Return only deleted fields by specifying that the attribute = "1"
- Note that "limit" attribute is required as illustrated in Example 6.

Example 2

To get all records with custom fields that do not have a specific value, add the datatype to the request with the desired values specified on the properties. For example, return all Project records where myCustomField is not equal to "756" and that have tax location ID that is not equal to 5.
Read, custom equal to

Use the Read, custom equal to command to return the custom field values for the record specified in the <Read/> request. For a list of associated datatypes that can be used, refer to the CustField datatype Association table. Refer to the example that follows.

```
<Read type="datatype" method="custom equal to" field_names="custom_field_name1,custom_field_name2" limit="500">
  <datatype>
    <id>X</id>
  </datatype>
</Read>
```

**Note:** "custom_field_name1" is an optional attribute which allows you to specify custom field names, such as those that appear in your OpenAir account, to be returned. If omitted, all custom field values for the record are returned.

Returned: The custom field records of an object of datatype with id equal to the id passed in, or failed status if that id doesn't exist. Note that "limit" attribute is required as illustrated in Example 6.

Read, user

Use the Read, user command to restrict the records returned in a <Read/> request.

```
<Read obtype="ObjectName" method="user" limit="500">
  <User>
    <id>X</id>
  </User>
</Read>
```

Returned: A list of "ObjectName" XML records that have a <userid> field equal to X (see above). Returns a failure message if "ObjectName" is a type that doesn't have a <userid> field.

**Note:** The following is subject to change without notice:

```
<Read type="Uprate" method="user" limit="500">
  <User>
    <id>X</id>
  </User>
</Read>
```

Returned:
The only three fields are projectid, userid, and rate. Uprate objects cannot be added, deleted, or modified.

**Note:** As with the "Read, all" command, you can restrict the number of fields within records returned by inserting `<_Return><field> </_Return>` syntax before `</Read>`. You can return only deleted fields by specifying that the attribute equals "1".

### Read, project

Use the Read, project command to restrict the records returned in a `<Read/>` request.

```xml
<Read type="datatype" method="project" limit="500">
  <Project>
    <id>X</id>
  </Project>
</Read>
```

Returned: A list of records that have a `<projectid>` field equal to X (see above). Make sure that the datatype used is a type that has a `<projectid>` field. Note that "limit" attribute is required as illustrated in Example 6.

**Note:** As with the "Read, all" command, you can restrict the number of fields within records returned by inserting `<_Return><field> </_Return>` syntax before `</Read>`. You can return only deleted fields by specifying that the attribute equals "1".

### Read, not exported

To request not-yet exported records, filter by not-exported. Note that "limit" attribute is required as illustrated in Example 6.

```xml
<Read type="Slip" filter="not-exported" method="all" limit="1000">
  <ImportExport>
    <application>MyApp</application>
  </ImportExport>
</Read>
```

Returned: slips that have not been marked as exported. Excludes exported records.

To mark returned Slip records as being exported, issue a modify command for each record returned and successfully exported in OpenAir system:

```xml
<Modify type="ImportExport"/>
```
Report

Use the Report command to run a report and email a PDF copy of a Timesheet, Envelope, or Saved report.

```xml
<Report type="datatype"> (datatype can be "Timesheet", "Envelope", or "Report")
  <Report>
    <relatedid>X</relatedid> (Timesheet, Envelope, or Saved report ID)
    <email_report>1</email_report>
  </Report>
</Report>
```

Returned: Success if report exists. The report runs and an email with a PDF attachment gets emailed to the user requesting the report.

Add

Attribute Table

Use the following attribute.

<table>
<thead>
<tr>
<th>Attribute Name</th>
<th>Value</th>
<th>Result</th>
</tr>
</thead>
<tbody>
<tr>
<td>enable_custom</td>
<td>1</td>
<td>Custom fields to be included inline with other native fields</td>
</tr>
</tbody>
</table>

Example 1

Use the Add command to add records.

```xml
<Add type="datatype">
  (One valid object matching datatype goes here.)
</Add>
```

Returned: An XML structure of type 'datatype' with all fields set to exactly how they appear in the OpenAir system. Included are a valid ID, an updated 'updated' timestamp, a correct 'created'. There is a limit of 1000 Add commands stacked in one request.
Note: User and Company records are added using the commands CreateAccount and CreateUser.

Example 2

```
<Add type="datatype" enable_custom="1">
    (One valid object matching datatype goes here.)
</Add>
```

Note: For more information, see Adding/Modifying Records with Inline Custom Field Values.

Example 3

In this example, the name of an existing category with externalid=111-222 is updated, or, if the category doesn’t exist, it is created.

```
<Add type="Category" lookup="externalid">
    <Category>
        <name>XML created category - updated</name>
        <externalid>111-222</externalid>
    </Category>
</Add>
```

Example 4

In this example, the externalid of an existing category (with XML-created name “category 1”) is updated, or, if the category, doesn’t exist, a new category is added.

```
<Add type="Category" lookup="name">
    <Category>
        <name>XML created category 1</name>
        <externalid>111-2222</externalid>
    </Category>
</Add>
```

Example 5

In this example, the Add command is used to create an employee’s CV in their resource profile and add it as an attachment. It is a two step process:

```
//Step 1

<Add type="ResourceAttachment">
    <ResourceAttachment>
        <type>CV</type>
        <userid>123</userid>
    </ResourceAttachment>
</Add>
```
//This returns an ID to use in the ownerid below, in Step 2:

//Step2

//The following step loads the CV. The CV file must be base64 encoded.
//The ownerid must be the same as the ResourceAttachment ID
//generated in Step 1.

<Add type="Attachment">
  <Attachment>
    <base64_data>U25lemth</base64_data>
    <file_name>Collins_Marc_CV.txt</file_name>
    <owner_type>ResourceAttachment</owner_type>
    <ownerid>98765</ownerid>
  </Attachment>
</Add>

Delete (id)

Use the Delete (id) command to delete records. The <id> of the object to be deleted MUST be sent in order for this command to be successful. There is a limit of 1000 Delete commands stacked in one request.

<Delete type="datatype">
  (One object of type 'datatype', only id need be passed in.)
</Delete>

Returned:

- Success if a datatype with ID equal to <id> existed and was deleted.
- Failure if the ID doesn't exist.
- A list of brief records (the only data field will be ID) if the record exists, but couldn't be deleted because a list of other records depends on it and must be deleted first.

Modify (id)

Attribute Table

Use the following attribute.

<table>
<thead>
<tr>
<th>Attribute Name</th>
<th>Value</th>
<th>Result</th>
</tr>
</thead>
<tbody>
<tr>
<td>enable_custom</td>
<td>1</td>
<td>Custom fields to be included inline with other native fields</td>
</tr>
</tbody>
</table>

Example 1

Use the Modify (id) command to change records. The <id> of the object to be modified MUST be sent in order for this command to be successful. There is a limit of 1000 Modify commands stacked in one
request. You can use an externalid field as a foreign key and modify a record without querying first for an internal id (see Example 5.)

```xml
<Modify type="datatype">
  (One object of type 'datatype', all fields included.)
</Modify>
```

Returned: An XML structure of type 'datatype' with all fields set to exactly how they appear in the OpenAir system, including an updated 'updated' timestamp.

**Example 2**

To mark records as exported:

```xml
<Modify type="ImportExport">
  <ImportExport>
    <application>MyAppName</application>
    <type>Slip</type>
    <id>10158</id>
    <exported>
      <Date>
        <year>2007</year>
        <month>03</month>
        <day>14</day>
        <hour>11</hour>
        <minute>25</minute>
        <second>15</second>
      </Date>
    </exported>
  </ImportExport>
</Modify>
```

**Example 3**

```xml
<Modify type="datatype" enable_custom="1">
  (One object of type 'datatype', all fields included.)
</Modify>
```

**Note:** For more information, see Adding/Modifying Records with Inline Custom Field Values.

**Example 4**

To modify a customer record:

```xml
<Modify type="Customer" enable_custom="1">
  <Customer>
    <id>15</id>
    <name>New name</name>
    <myCustomField__c>10158</myCustomField__c>
  </Customer>
</Modify>
```
Example 5

To modify a project record using an externalid lookup (for external Customer 805–25664):

```xml
<Modify type="Project">
  <Project>
    <id>200</id>
    <customerid external="Customer">805-25664</customerid>
  </Project>
</Modify>
```

Example 6

In this example, modify updates the cost_centerid property of the category with id=3. The API looks up the internal id of the Costcenter with externalid 6655 and assigns the cost_centerid property of the target category with a corresponding internal id.

```xml
<Modify type="Category">
  <Category>
    <id>3</id>
    <cost_centerid external="Costcenter">6655</cost_centerid>
  </Category>
</Modify>
```

Example 7

In this example, modify updates the cost_centerid property of the category with id=3. The API looks up the internal id of a Costcenter with the name "Maintenance" and assigns the cost_centerid property of the target category with a corresponding internal id.

```xml
<Modify type="Category">
  <Category>
    <id>3</id>
    <cost_centerid name="Costcenter">Maintenance</cost_centerid>
  </Category>
</Modify>
```

Modify (Logo)

Note: The following is subject to change without notice.
where:

- <name> is either "html_logo" or "pdf_logo"
- <type> is calculated from the contents of the </binary> field (see below).
- <filename> is used for display purposes.
- <binary> is the actual content of the Logo file and should be sent in a Base64 encoded string, as XML does not support real binary fields.

Returned: An XML structure of type 'Logo' with all fields set to their actual value in the OpenAir system.

Modify, custom equal to

**Note:** Modify, custom equal to is deprecated, but still supported. We recommend that you use inline custom fields by using the enable_custom attribute and specify custom fields with "_c" postfix. (Remember, there are two underscores before the c.) See Adding/Modifying Records with Inline Custom Field Values.

Use the Modify, custom equal to command to set a custom field of an existing record. There is a limit of 1000 Modify commands stacked in one request.

```xml
<Modify type="datatype" method="custom equal to">
  <datatype>
    <id>X</id>
    <custom_field>custom_field_name</custom_field>
    <value>X</value>
  </datatype>
</Modify>
```

**Note:** custom_field_name is the field name as it appears in CustField properties, not the name of the database column that was created for that field or the Display Name of the field.

Submit

Use the Submit command to submit a Booking, Envelope, Invoice, or Timesheet for approval. There is a limit of 1000 Submit commands stacked in one request.

```xml
<Submit type="Timesheet">
  <Timesheet>
    <id>35</id>
  </Timesheet>
</Submit>
```
CreateAccount

Use the CreateAccount command to create a new OpenAir account. When a new account is created, the first user (the account administrator) is also created.

The fields listed below are the minimum required fields. Any field in User and Company may be supplied at account creation.

```
<CreateAccount>
  <Company>
    <nickname/>
  </Company>
  <User>
    <nickname/>
    <password/>
    <addr>
      <Address>
        <email/>
      </Address>
    </addr>
  </User>
</CreateAccount>
```

Returned: Two XML structures — one of type 'Company' and the other of type 'User'. Both have fields set exactly as they appear in the OpenAir system. The type 'User' is always set to 'Administrator' for the first user created.

CreateUser

Use the CreateUser command to create a new user within an existing OpenAir account. There is a limit of 1000 CreateUser commands stacked in one request.

The fields listed below are the minimum required fields. Any valid field in User may be populated at User creation time except custom fields. To set a user workschedule, refer to User.

The CreateUser command will fail unless preceded by a valid Auth command for an Administrator user of this company. For more information, refer to Auth.

```
<CreateUser>
  <Company>
    <nickname/>
  </Company>
  <User>
    <nickname/>
  </User>
</CreateUser>
```
Returned: An XML structure of type 'User' that has all fields set to exactly as they appear in the OA system. The default type 'User' is 'User' for all CreateUser requests.

Auth

The Auth command authenticates a user into the specified account. It is the equivalent of entering company, user, and password information into the Login form on the product. It does not maintain any state after the request is finished. Many commands such as Read, Modify, and Delete require a valid Auth to succeed.

Returned: A success or fail status is returned. On success, subsequent commands such as Read, Modify, etc., will be able to access the data associated with the Login user.

RemoteAuth

Use the RemoteAuth command to log in to an individual account in OpenAir. It returns a URL to the newly created session.

The difference between Auth and RemoteAuth is that RemoteAuth actually creates a valid user session, while Auth simply authenticates for the life of that individual request.

RemoteAuth is used by partners to perform Single Sign-on, where end users never have to log in to their OpenAir account. The RemoteAuth command takes care of this internally. RemoteAuth should not be used as a substitute for Auth.

Returned: A success or fail status is returned. On success, a URL returns that will place the user into the OpenAir system.
MakeURL

Use the MakeURL command to obtain a URL for a specific application and screen. For instance, MakeURL can return a URL to display the Company Settings screen. It requires a valid user login to succeed. The list of valid views is listed below.

Note: The following is subject to change without notice.

```xml
<MakeURL>
  <uid>1234</uid>
  <page>page name</page>
  <app>app abbreviation</app>
  <arg>
    <Envelope>
      <id>3</id>
    </Envelope>
  </arg>
</MakeURL>
```

where:
- `<uid>` is the user id of a valid logged-in user.
- `<page>` is a string from the valid list of pages (see below).
- `<app>` is 'km', 'ma', 'pb', 'rm', 'pm', 'ta', 'te', or 'tb' (See below).
- `<arg>` is an optional argument, should the page require it.

The following lists valid page strings with associated applications and arguments:

- **default-url**
  app= km, ma, pb, rm, pm, ta, te, or tb (points to the starting page in any one of the applications - the page you would see when you click on the application link.)
  For example: If you were using pm as the `<app>` attribute, the first page would be the Projects list in the Projects module for users with administrative privileges. For non-administrative users, it would be the list of tasks to which the user is assigned.

- **company-settings**
  app= ma (points to Administration > Global Settings)

- **currency-rates**
  app= ma (points to Administration > Global Settings > Currencies)

- **import-export**
  app= ma (points to Administration > Global Settings > Integration: Import/Export)

- **custom-fields**
  app= ma (points to Administration > Global Settings > Custom Fields)

- **list-reports**
  app= ma (points to Reports > last page accessed)

- **list-customers**
  app= ma (points to Administration > Global Settings > Customers)

- **list-projects**
  app= pm (points to Projects > Projects)
- list-prospects
  app= om (points to Opportunities > Prospects)
- list-resources
  app= rm (points to Resources > Resources)
- list-timesheets
  app= ta (points to Timesheets > Timesheets > Open)
- create-timesheet
  app= ta (points to Timesheets > Create Timesheet)
- list-timebills
  app= tb (points to Invoices > Charges)
- list-invoices
  app= tb (points to Invoices > Invoices)
- create-invoice
  app= tb (points to Invoices > Invoices > Create Invoice)
- list-envelope-receipts
  app= te (points to Expenses > Expense Reports > Receipts)
  arg= <arg> <Envelope> <id>X</id> </Envelope> </arg>
- list-envelopes
  app= te (points to Expenses > Expense Reports > Open)
- create-envelope
  app= te (points to Expenses > Expense Reports > Create Envelope)
- create-envelope-receipt
  app= te (points to Expenses > Expense Reports > Create Receipt)
- dashboard
  app= ma (points to Dashboard)
- list-purchase-requests
  app= po (points to Purchases > Purchase Requests)
- quick-search-resources
  app= rm (points to Resources > Quick Search)
- custom-search-resources
  app= rm (points to Resources > Custom Search)
- view-invoice
  app= tb (displays the invoice with specified internal id)
  arg= <arg> <Invoice> <id>X</id> </Invoice> </arg>
- dashboard-project
  app= pm (displays the dashboard view of the project with specified internal id)
  arg= <arg> <Project> <id>X</id> </Project> </arg>
- grid-timesheet
  app= ta (displays the grid of the timesheet with specified internal id)
  arg= <arg> <Timesheet> <id>X</id> </Timesheet> </arg>
- report-timesheet
app= ta (displays the timesheet report of specified internal id)

arg= <arg> <Timesheet> <id>X</id> </Timesheet> </arg>

Returned: A URL points to the desired page.

Whoami

Example 1

The Whoami command returns information about the currently authenticated user. It is the equivalent of using the Read command for User:

```xml
<Read type="User">
  <User>
    <id>X</id>
  </User>
</Read>
```

Whoami is as follows:

```xml
<Whoami>
  <User>1234</uid>
    <id>X</id>
  </User>
</Whoami>
```

Returned: The User XML record of the current authorized user. If a valid authorization did not occur, an error status is returned.

Example 2

An Auth request with the Whoami command:

```xml
<Auth>
  <Login>
    <user>a</user>
    <company>b</company>
    <password>c</password>
  </Login>
</Auth>

<Whoami>
</Whoami>
```

Version

Note: The following Version command is for OpenAir Internal use only.

Use the Version command to look for client version information in the client's download/Versions file to see if a newer version of the client is available for download.
where:

- `<number>` is the version number of the client.
- `<url>` is the URL for the download of the latest version of the client.
- `<size>` is the size of the downloadable file.

## Approve

Use the Approve command to approve a Booking, Envelope, Invoice, or Timesheet submitted for approval. There is a limit of 1000 Approve commands stacked in one request.

```xml
<Approve type="Timesheet">
  <Timesheet>
    <id>308</id>
  </Timesheet>
  <Approval>
    <cc>name@company.com</cc>
    <notes>Approved</notes>
  </Approval>
</Approve>
```

Returned: A success or fail status is returned.

## Reject

Use the Reject command to reject a Booking, Envelope, Invoice, or Timesheet submitted for approval. There is a limit of 1000 Reject commands stacked in one request.

```xml
<Reject type="Timesheet">
  <Timesheet>
    <id>341</id>
  </Timesheet>
  <Approval>
    <cc>name@company.com</cc>
    <notes>Rejected</notes>
  </Approval>
</Reject>
```

Returned: A success or fail status is returned.

## Unapprove

Use the Unapprove command to unapprove a previously approved Booking, Envelope, Invoice, or Timesheet. There is a limit of 1000 Unapprove commands stacked in one request.
<Unapprove type="Timesheet">  
  <Timesheet>  
    <id>231</id>  
  </Timesheet>  
  <Approval>  
    <cc>name@company.com</cc>  
    <notes>Approved</notes>  
  </Approval>  
</Unapprove>

Returned: A success or fail status is returned.

**ModifyOnCondition**

Use the ModifyOnCondition command to perform actions such as updating the external_id of a record type only if the update time on the OpenAir server is older.

```xml
//ModifyOnCondition command supporting the "If-not-updated" condition
<ModifyOnCondition condition="if-not-updated" type="Booking">
  //Followed by the object to update, for example, "Booking"
  <Booking>
    <id>2</id>
    <external_id>123456789</external_id>
    <notes>New notes</notes>
    <user_id>152</user_id>
  </Booking>
  //Next, the date object to compare against
  <Date>
    <day>01</day>
    <month>01</month>
    <year>2017</year>
    <hour>20</hour>
    <minute>05</minute>
    <second>09</second>
  </Date>
</ModifyOnCondition>
```

Returned:

If `<Date>` is older than “modified” in the database, the command will return the full record from the database and the status “1200” (Command wasn't executed because condition wasn't met. Returning the record from DB.).

If `<Date>` is newer than or equal to “modified” in the database, the command will modify the record and return only the saved information (as with a standard Modify command). The Status will be “0” (Success).
Custom Fields

Custom fields are helpful additions to your OpenAir account. Use the CustField datatype to get a list of custom field metadata related to the custom fields in your OpenAir account such as name, association, and picker type (use with Read, custom equal to method).

Several options exist for working with custom fields. You may request all available custom fields that exist for a given datatype or you may read custom field values for a specific record. You can also modify records to set custom field values or add/modify records with inline custom field values.

Refer to the following sections for more information on working with custom fields. Links to commands and code examples are provided.

**Note:** It is not possible to rename, change, or delete a custom field which is being used by an active script. This prevents unintended script problems.

### Requesting Custom Fields for a Datatype

You can request all custom fields that exist for a given datatype. Use the Read, equal to command and specify the CustField type and filter for a particular association. Refer to the CustField datatype Association table for a list of possible associations.

### Reading Custom Field Values Inline with Native Fields

You can read custom records with inline custom field values.

1. Custom fields can optionally be returned using custom field names (as defined in your OpenAir account) with "__c" added to the end of the name. (Note that there are two underscores before the c.) The enable_custom = "1" attribute is required to include custom fields inline. See the enable_custom attribute for Read.

2. Use custom fields as lookup values using "equal to" or "not equal to" methods. Use the "__c" naming syntax as specified above and include the custom fields in the argument to the read method. The enable_custom = "1" attribute is required to include custom fields inline. See XML Commands for read and the following examples:
   - Example 7 for Read “equal to”
   - Example 2 for Read “not equal to”

**Note:** Remember, custom field names cannot start with a number or with the letters “xml” in any form such as XML or Xml. For example, 1MyCustomField or xmlMyCustomField will not work.

### Reading Custom Field Values in a Separate Request

You can read custom field values for a given record. Use the Read, custom equal to command to request custom field values for a particular record. You need to know the internal ID of the record in question.
Adding/Modifying Records with Inline Custom Field Values

You can add or modify records with inline custom field values.

1. Use the field name and add "__c" to the end of the name. (Note that there are two underscores before the c.)

2. Specify custom fields as part of an argument object to an add or modify request. Set the "enable_custom" attribute equal to 1. See the XML Commands for add and modify and the following examples:
   - Example 2 for Add custom field
   - Example 3 and Example 4 for Modify custom fields

**Note:** Remember, custom field names cannot start with a number or with the letters "xml" in any form such as XML or Xml. For example, 1MyCustomField or xmlMyCustomField will not work.

**Note:** If a custom field update fails due to: 1) optional uniqueness of the field, or 2) when the value of the custom field does not match an acceptable value, you may receive a warning. The Add or Modify request status is set to the following:

- 1106 and detailed <error> message would be returned with the description of specific custom field errors.

It is important to note that the parent record would be saved successfully, but the custom fields will fail to be updated. Refer to the following example:

```xml
<?xml version="1.0" encoding="UTF-8" standalone="yes"?>
<response>
  <Modify status = "1106">
    <Customer>
      <cust_cust__c/><cust_date__c>2012-03-29</cust_date__c><cust_cust__c/>
    </Customer>
    <errors>Custom field cust_cust__c failed to save with status code: 1104</errors>
  </Modify>
</response>
```

See Appendix A Error Code Listing for Custom Field Errors, specifically error code 1106.

Modifying Records to Set Custom Field Values

You can modify records to set custom field values. Use the Modify, custom equal to command to set custom fields.

Setting Allocation Grid Custom Field Values

When setting values for allocation grid custom fields, use the format illustrated in the following example:
<my_allocation_grid__c>"Marc Collins",0
"Bill Carter",0
"Marie Porter",50
"Ed Ellis",50</my_allocation_grid__c>

⚠️ **Important:** When setting values for allocation grid custom fields, each value-number pair must be on a separate line.
XML Datatypes

OpenAir contains the following XML datatypes. Click on the datatype to see the list of field names and associated descriptions as well as links to supported commands.

**Important:** The updated and created fields are maintained automatically by the system. You can read these values, but they cannot be modified.

</tbody>
</table>
Actualcost

Use the Actualcost datatype to add or update actual cost information.

```
<Actualcost>
  <id/> Unique ID. Automatically assigned by the system.
  <name/> The name of the actual cost. This field is never populated. It is used only to satisfy subtotalling by actual cost.
  <date/> Date for the actual cost.
  <userid/> The ID of the user.
  <externalid/> If the record was imported from an external system, you store the unique external record id here.
  <period/> The time period of the actual cost: Daily, Weekly, Monthly, Quarterly, Annually.
  <created/> Time the record was created.
  <updated/> Time the record was last updated or modified.
  <notes/> Notes.
  <currency/> Currency of the cost field.
  <cost/> The cost.
  <cost_typeid/> The ID of the cost_type.
  <is_accrual/> A 1/0 field indicating whether this actual cost is an accrual.
</Actualcost>
```

This datatype supports the read, add, and modify XML Commands.

AccountingPeriod

The AccountingPeriod datatype holds a date range defining an accounting period.

```
<AccountingPeriod>
  <id/> Unique ID. Automatically assigned by the system.
  <name/> The name of the accounting period.
  <start_date/> The starting date of the period.
  <end_date/> The ending date of the period.
  <period_date_how/> What date should be used when marking transactions to this period:
    'S'tart date
    'E'nd date
    'P'eriod date
  <period_date/> The custom date to use for this period.
  <current_period/> A 1/0 field indicating whether this is the current period.
  <default_period/> A 1/0 field indicating whether this is the default period.
  <notes/> Notes field.
  <active/> A 1/0 field indicating whether this period is open or closed.
</AccountingPeriod>
```
This datatype supports the read, add, modify, and delete XML Commands.

**Address**

Use the Address datatype for XML sub-structures of address-related information.

This datatype supports the add, CreateAccount, CreateUser, and modify XML Commands. The following is an example of how a contact's city would be represented.

```xml
<Contact>
  <addr>
    <Address>
      <city>X</city>
    </Address>
  </addr>
</Contact>
```

**Note:** The `<Address/>` datatype now has a "customer_only" attribute, which is used for backwards compatibility support of `<billingaddr/>` for `<Customer/>`. If you set this attribute to "yes", only the billing address of the customer, and not its associated contact, will be updated when modifying the customer record. See Customer for more information.

**Agreement**

Use the Agreement datatype to track money through projects and billings.
<Agreement>
   <id/> Unique ID. Automatically assigned by the system.
   <number/> The agreement number.
   <date/> The date of the agreement.
   <name/> The name of the agreement.
   <active/> A 1/0 field indicating whether this is an active agreement.
   <externalid/> External ID.
   <total/> The agreement total. Dated by the date field.
   <created/> Time the record was created.
   <currency/> Currency for the money fields in the record.
   <notes/> Notes.
   <customerid/> Customer ID.
   <updated/> Time the record was last modified.
   <code/> Optional accounting system code for integration with external accounting systems.
   <acct_date/> The accounting period date of the agreement.
   <picklist_label/> Label as shown on form picklist.
</Agreement>

This datatype supports the read, add, modify, and delete XML Commands.

Agreement_to_project

Use the Agreement_to_project datatype to create a many-to-many link between projects and agreements.

<Agreement_to_project>
   <id/> Unique ID. Automatically assigned by the system.
   <agreementid/> The ID of the associated agreement.
   <customerid/> The ID of the associated customer. Does not need to be input as it can be derived inline from project_id.
   <projectid/> The ID of the associated project.
   <active/> A 1/0 field indicating whether this is an active agreement.
   <created/> Time the record was created.
   <updated/> Time the record was last modified.
</Agreement_to_project>

This datatype supports the read, add, modify, and delete XML Commands.

Approval

Use the Approval datatype to store approval information for timesheets, expense reports, and proposals.

<i>Note: </i> This datatype is not used to read the “approval” table. See ApprovalLine.

<Approval>
   <cc/> Email cc field.
   <notes/> Notes.
</Approval>
This datatype supports the Submit command.

ApprovalLine

Use the ApprovalLine datatype to read the approval table. This datatype is read-only.

```
<ApprovalLine>
  <id/> Unique ID. Automatically assigned by the system.
  <approvalid/> ID of the associated approval. Represents a meta-approval, or an "approval confirmation".
  <status/> The status of the child meta-approval. Only assigned a value if the record has a meta-approval.
    S - Submitted
    A - Approved
    R - Rejected
  <timesheetid/> ID of the associated timesheet.
  <envelopeid/> ID of the associated envelope (expense report)
  <proposalid/> ID of the associated proposal
  <purchaserequestid/> ID of the associated purchaserequest
  <purchaseorderid/> ID of the associated purchaseorder
  <authorizationid/> ID of the associated authorization
  <schedule_requestid/> ID of the associated schedule request
  <booking_requestid/> ID of the associated booking request
  <deal_booking_requestid/> ID of the associated deal booking request
  <invoiceid/> ID of the associated invoice
  <revenue_containerid/> ID of the associated revenue_container
  <bookingid/> ID of the associated booking
  <customerid/> ID of the associated customer
  <project_budget_groupid/> ID of the associated project budget group
  <projectid/> ID of the associated project if this is a project approval
  <userid/> ID of the user. A submittal record has the id of the user whose approvals are to be followed, this is usually the user who submitted the request, but for booking requests, it may be either the submitter or the user for whom the booking request is for depending on setting. All other records have the ID of the approver.
  <submitter/> ID of the user submitting the approval. Only valid for a submittal record (action = 'S').
  <approvalprocessid/> ID of the approval process if this is associated with an approval process.
  <approvalprocess_ruleid/> ID of the approval process rule if this is associated with an approval process.
  <seq_number/> If this is associated with an approval process, this is the sequence number associated with it.
  <action/> The approval action.
    S - Initial submittal for approval
    P - Pending approval request
    A - Acceptance of approval request
    R - Rejection of approval request
    U - Unapproval action
  <date/> Date and time of the action
  <pending_done/> If the action is 'P'ending, this flag is set to 1 once an 'A' or 'R' action record is created.
  <project_total/> If this is a project-based approval this holds the total amount (money or hours) that was approved.
```
ApprovalLine

This datatype supports the Read command.

Approvalprocess

Use the Approval Process datatype to read approval process information.

This datatype supports the read, add, modify, and delete XML Commands.

Attachment

Use the Attachment datatype to specify information about task and proposal attachments and documents or folders.

This datatype supports the read, add, modify, and delete XML Commands.
Attribute

Use the Attribute datatype to read attribute information.

```
<Attribute>
  <id/> Unique ID. Automatically assigned by the system.
  <name/> The name of the attribute.
  <attribute_setid/> The name of the attribute.
  <updated/> Time the record was last modified.
  <created/> Time the record was created.
  <notes/> Attribute notes.
</Attribute>
```

This datatype supports the read XML Commands.

AttributeDescription

Use this datatype for descriptions of attributes in resource profiles, for example, detailed descriptions of what characteristics define various language levels (beginner, intermediate, advanced) or technical competencies.

```
<AttributeDescription>
  <id/> Unique ID. Automatically assigned by the system.
  <resourceprofile_typeid/> ID of the resourceprofile_type.
  <attributeid/> ID of the attribute.
  <description/> Information about the attribute in context of specific resourceprofile_type.
  <deleted/> A "1/0" field indicating if the record was deleted.
  <created/> Time the record was created.
  <updated/> Time the record was last modified.
</AttributeDescription>
```

This datatype supports the read, add, modify, and delete XML Commands.

Attributeset

Use the Attributeset datatype to read attributeset information.

```
<Attributeset>
  <id/> Unique ID. Automatically assigned by the system.
  <name/> The name of the attributeset.
  <updated/> Time the record was last modified.
  <created/> Time the record was created.
  <notes/> Attributeset notes.
</Attributeset>
```

This datatype supports the read XML Commands.

BillingSplit

Use the BillingSplit datatype to read attributeset information.
**BillingSplit**

- `<id/>` Unique ID. Automatically assigned by the system.
- `<splitid/>` The id of the slip that was created.
- `<project_billing_transactionid/>` The ID of the associated project billing transaction.
- `<taskid/>` The ID of the associated task.
- `<updated/>` Time the record was last modified.
- `<created/>` Time the record was created.

This datatype supports the read XML Commands.

**Booking**

Use the Booking datatype to book a user to a project.

- `<id/>` Unique ID. Automatically assigned by the system.
- `<hours/>` The number of hours booked to this project during this date range. This is either the actual booked hours or derived from the percentage.
- `<ownerid/>` The ID of the associated user creating the booking.
- `<userid/>` The ID of the associated user.
- `<startdate/>` The start date of the booking.
- `<percentage/>` The percentage of time booked to this project during this date range. This is either the actual booked percentage or derived from the hours.
- `<projectid/>` The ID of the associated project.
- `<externalid/>` If the record was imported from an external system you store the unique external record ID here.
- `<booking_typeid/>` The ID of the associated booking_type.
- `<project_taskid/>` The ID of the task within the assoc. project.
- `<created/>` Time the record was created.
- `<repeatid/>` The ID of the associated repeating event.
- `<enddate/>` The end date of the booking.
- `<notes/>` Booking notes.
- `<customerid/>` The ID of the associated customer.
- `<as_percentage/>` A 1/0 field indicating which of the fields (hours or percentage) are actual, and which is derived. 1 = percentage is actual and hours is derived. 0 = hours in actual and percentage is derived.
- `<starttime/>` Start time.
- `<endtime/>` End time.
- `<job_code_id/>` The ID of the associated job code.
- `<locationid/>` The location ID for this booking.
- `<notify_owner/>` A 1/0 field indicating whether to send email to the requestor when the booking is modified.
- `<date_approved/>` The date the booking request was approved.
- `<date_submitted/>` The date the booking_request was submitted.
- `<approval_status/>` The approval status of the booking request (O - Open, S - Submitted, A - Approved, R - Rejected).
- `<project_assignment_profile_id/>` The id of the associated project assignment profile.
<source_booking_id/> Id of the booking used to create this booking.
</Booking>

This datatype supports the read, add, modify, submit, approve, reject, unapprove, and delete XML Commands.

## BookingByDay

Use the BookingByDay datatype to access a day by day representation of the booking table.

```xml
<BookingByDay>
  <id/> Unique ID. Automatically assigned by the system.
  <date/> The date of the booking.
  <booking_id/> The ID of the associated booking.
  <customer_id/> The ID of the associated customer.
  <project_id/> The ID of the associated project.
  <project_task_id/> The ID of the task within the associated project.
  <booking_type_id/> The ID of the associated booking_type.
  <job_code_id/> The ID of the associated job code.
  <hours/> The number of booked hours on this date for this customer/project/user/booking_type. High precision to reduce effect of rounding.
  <userid/> The ID of the associated user.
  <created/> Time the record was created.
  <updated/> Time the record was last modified.
</BookingByDay>
```

This datatype supports the read XML Commands.

## BookingType

Use the BookingType datatype to describe a booking type such as billable, non-billable, or business development used in Resources module bookings.

```xml
<BookingType>
  <id/> Unique ID. Automatically assigned by the system.
  <priority/> The priority of the booking type (1 - 9).
  <created/> Time the record was created.
  <notes/> Booking notes.
  <name/> The name of the booking type.
  <active/> A 1/0 field specifying if the type is active.
  <updated/> Time the record was last modified.
  <picklist_label/> Label as shown on form picklist.
</BookingType>
```

This datatype supports the read, add, and modify XML Commands.

## Booking_request

Use the Booking_request datatype to read booking requests.
<Booking_request>
  <id/> Unique ID. Automatically assigned by the system.
  <number/> The booking_request number that increments by 1.
  <project_task_id/> The id of the task within the associated project.
  <startdate/> The start date of the booking_request.
  <job_code_id/> The id of the associated job code.
  <notify_owner/> A "1/0" field indicating whether to send email to the booking request owner changes occur to the resulting bookings.
  <customer_id/> The id of the associated customer.
  <date_approved/> The date the booking_request was approved.
  <enddate/> The end date of the booking_request.
  <updated/> Time the record was last updated or modified.
  <as_percentage/> A "1/0" field indicating which of the fields...hours or percentage are actual, and which is therefore derived. Only one value can be actual. If 1 then percentage is the actual, hours is derived. If 0 then percentage is derived, hours is actual.
  <project_id/> The id of the associated project.
  <date_submitted/> The date the booking_request was submitted.
  <hours/> The number of hours booked to this project during this date range. This is either the actual booked hours or derived from the percentage.
  <attachment_id/> If non-zero, the attachment record associated with this booking_request.
  <approval_status/> The approval status of the booking request
    'O'pen
    'P'ending approval
    'A'pproved
    'R'ejected
  <booking_type_id/> The id of the associated booking_type.
  <name/> The name of the booking_request (Prefix + number).
  <percentage/> The percentage of time booked to this project during this date range. This is either the actual booked percentage or derived from the hours.
  <description/> The description or purpose for the booking_request.
  <repeat_id/> The id of the associated repeating event.
  <created/> Time the record was created.
  <external_id/> If the record was imported from an external system you store the unique external record id here.
  <notes/> Booking notes
  <user_id/> The id of the associated user.
  <owner_id/> The id of the associated user creating the booking request.
  <prefix/> A static alphanumeric booking_request number prefix.
</Booking_request>

This datatype supports the read XML Commands.

**Budget**

Use the Budget datatype to create a budget entry.
Budget

This datatype supports the read, add, and modify XML Commands.

BudgetAllocation

Use the BudgetAllocation datatype to allocate users and activity to a budget.

Category

Use the Category datatype for a service, category, activity or time type in the Proposals, Timesheets, and Invoices modules. Typically, only one of the rate mechanisms will be set.
<taxable/> A 1/0 field indicating whether this item is taxable, vat-taxable, and so on.
<externalid/> If the record was imported from an external system you store the unique external record ID here.
<other_rate_type/> The time the other_rate field applies to. Valid entries are Day, Week, Month, Quarter, Year and Session.
<other_rate/> The rate for another time billing metric.
<currency/> Currency for the money fields in the record.
<created/> Time the record was created.
<rate/> The hourly billing rate.
<cost_centerid/> The ID of the associated cost center.
<fixed_fee/> The fixed fee value of this service.
<updated/> Time the record was last updated or modified.
<code/> Optional accounting system code for integration with external accounting systems.
<notes/> Category notes.
<picklist_label/> Label as shown on form picklist.
</Category>

This datatype supports the read, add, modify, and delete XML Commands.

Category_1

Use the Category_1 datatype for extended category capability for transactions. It provides the ability to relate transactions to one or more built-in categories such as Category_2, Category_3, Category_4, and Category_5.

<Category_1>
  <id/> Unique ID. Automatically assigned by the system.
  <name/> The category name.
  <code/> Optional accounting system code for integration with external accounting systems.
  <externalid/> If the record was imported from an external system you store the unique external record ID here.
  <active/> A 1/0 field indicating whether this is designated as an active customer.
  <created/> Time the record was created.
  <updated/> Time the record was last updated or modified.
  <notes/> Category notes_1.
  <picklist_label/> Label as shown on form picklist.
</Category_1>

This datatype supports the read, add, modify, and delete XML Commands. Use custom equal to when requesting custom fields.

Category_2

Use the Category_2 datatype for extended category capability for transactions. It provides the ability to relate transactions to one or more built-in categories such as Category_1, Category_3, Category_4, and Category_5.

<Category_2>
This datatype supports the read, add, modify, and delete XML Commands. Use custom equal to when requesting custom fields.

Category_3

Use the Category_3 datatype for extended category capability for transactions. It provides the ability to relate transactions to one or more built-in categories such as Category_1, Category_2, Category_4, and Category_5.

This datatype supports the read, add, modify, and delete XML Commands. Use custom equal to when requesting custom fields.

Category_4

Use the Category_4 datatype for extended category capability for transactions. It provides the ability to relate transactions to one or more built-in categories such as Category_1, Category_2, Category_3, and Category_5.
If the record was imported from an external system you store the unique external record ID here.

A 1/0 field indicating whether this is designated as an active customer.

Time the record was created.

Time the record was last updated or modified.

Category notes_4.

Label as shown on form picklist.

This datatype supports the read, add, modify, and delete XML Commands. Use custom equal to when requesting custom fields.

Category_5

Use the Category_5 datatype for extended category capability for transactions. It provides the ability to relate transactions to one or more built-in categories such as Category_1, Category_2, Category_3, and Category_4.

Unique ID. Automatically assigned by the system.

The category name.

Optional accounting system code for integration with external accounting systems.

If the record was imported from an external system you store the unique external record ID here.

A 1/0 field indicating whether this is designated as an active customer.

Time the record was created.

Time the record was last updated or modified.

Category notes_5.

Label as shown on form picklist.

This datatype supports the read, add, modify, and delete XML Commands. Use custom equal to when requesting custom fields.

Ccrate

Use the Ccrate datatype to document the category customer rate table.

Unique ID. Automatically assigned by the system.

The ID of the category this rate is associated with.

The currency these rates are quoted in.

The hourly billing rate.

Time the record was created.

Notes about the table.

The ID of the customer this rate is associated with.

Time the record was last updated or modified.
This datatype supports the read XML Commands.

Company

Use the Company datatype to specify basic company information and the company switches.

```
<Company>
  <id/> Unique ID. Automatically assigned by the system.
  <addr/> The company’s address.
  <VAT_registration_number/> VAT registration number.
  <hide_rate/> Hide hourly rate from normal user types in the company.
  <updated/> Time the record was last updated or modified.
  <company/> The company name, as it should be printed on invoices.
  <nickname/> The company nickname.
  <is_multicurrency/> Multiple currencies.
  <currencies/> The currencies for the money fields in the record.
  <businesstype/> General business category.
  <created/> The time the record was created.
  <base_currency/> Base currency.
  <rate_from/> Billing rate is pulled from: category, user, customer/project, or user/project.
  <workscheduleid/> The ID of the associated primary account workschedule. (read-only field)
  <flags/> Company-specific flags.
</Company>
```

This datatype supports the read, add, and modify XML Commands. Also refer to the Flag datatype.

Contact

Use the Contact datatype to specify contact information. A contact is associated with a customer, particular client, or prospect company.

```
<Contact>
  <id/> Unique ID. Automatically assigned by the system.
  <addr/> The contact’s address.
  <customer_company/> Import-only field to specify customer by company name. Can be used in place of </customerid>.
  <job_title/> The contact’s job title.
  <updated/> Time the record was updated or modified.
  <can_bill_to/> A 1/0 field indicating if the contact can be a billing contact.
  <code/> Optional accounting system code for integration with external accounting systems.
  <name/> The name of the contact. This will be automatically generated if not supplied.
  <active/> A 1/0 field indicating an active contact.
  <externalid/> If the record was imported from an external system you store the unique external record ID here.
</Contact>
```
<can_sold_to/> A 1/0 field indicating if the contact can be a sold to contact.
<created/> Time the record was created.
<notes/> Notes field.
<customerid/> The ID of the associated customer.
<customer_externalid/> The external ID for the associated customer.
<can_ship_to/> A 1/0 field indicating if the contact can be a shipping contact.
<exported/> Date and time the record was marked as "exported".
<picklist_label/> Label as shown on form picklist.
</Contact>

This datatype supports the read, add, modify, and delete XML Commands.

**Costcategory**

Use the Costcategory datatype to add or update cost category information.

<Costcategory>
  <id/> Unique ID. Automatically assigned by the system.
  <name/> The name of the cost category.
  <active/> A 1/0 field indicating if this cost category is active.
  <notes/> Notes.
  <created/> Time the record was created.
  <updated/> Time the record was last updated or modified.
  <externalid/> If the record was imported from an external system, you store the unique external record ID here.
</Costcategory>

This datatype supports the read, add, and modify XML Commands.

**Costcenter**

Use the Costcenter datatype to specify cost center information.

<Costcenter>
  <id/> Unique ID. Automatically assigned by the system.
  <created/> Time the record was created.
  <notes/> Cost center notes.
  <name/> The name of the cost center.
  <active/> A 1/0 field indicating whether this is active.
  <updated/> Time the record was last updated or modified.
  <externalid/> If the record was imported from an external system you store the unique external record ID here.
  <code/> Optional accounting system code for integration with external accounting systems.
  <picklist_label/> Label as shown on form picklist.
</Costcenter>

This datatype supports the read, add, modify, and delete XML Commands.
Costtype

Use the Costtype datatype to add or update cost category information.

```xml
<Costtype>
  <id/> Unique ID. Automatically assigned by the system.
  <name/> The name of the cost category.
  <active/> A 1/0 field indicating if this cost category is active.
  <externalid/> If the record was imported from an external system, you store the unique external record ID here.
  <created/> Time the record was created.
  <updated/> Time the record was last updated or modified.
  <notes/> Notes.
  <cost_categoryid/> The ID of the associated cost category.
</Costtype>
```

This datatype supports the read, add, and modify XML Commands.

Currency

Use the Currency datatype to specify exchange rates that override market rates.

```xml
<Currency>
  <rate/> The account's custom conversion rate.
  <created/> Time the record was created.
  <symbol/> The currency symbol.
  <updated/> Time the record was last updated or modified.
</Currency>
```

This datatype supports the read, add, and modify XML Commands.

Currencyrate

Use the Currencyrate datatype to read currency rates.

```xml
<Currencyrate>
  <crate/> The account's currency conversion rate.
  <csymbol/> The currency symbol.
  <cname/> The name of the currency rate.
  <date/> The date of the rate.
  <type/> Blank for rates with date filled in, otherwise: PAST for conversion rates for dates prior to the first date in the table and FUTURE for conversion rate for dates in the future.
</Currencyrate>
```

This datatype supports the read XML Commands.

CustField

Use the CustField datatype to retrieve metadata about custom fields such as name, association, and picker type.
<CustField>
	<id/> Unique ID. Automatically assigned by the system.
	<userid/> The ID of user who created or owns this custom field.
	<rows/> The number of display rows for text area fields
	<size/> The display size of the field on forms.
	<valuelist/> A list of values for radio groups and popup menu
fields in csv format.
	|required/> A 1/0 field indicating if this field is required.
	<decpos/> The decimal size of the field.
	<picker/> The type of field for on screen representation:
numeric, currency, date, text, textarea, check, radio, drop
down, drop text, selector, or alloc_gr.
	<association/> The table or datatype this field is associated
with. See the Association table for possible associations.
	<updated/> Time the record was last updated or modified.
	<seq/> The sequence number of the field.
	<divider_text/> Optional divider text.
	<maxlength/> The maximum length of data in the field.
	<mover/> A 1/0 field indicating if the selector should have mover
controls.
	<name/> The name of the custom field.
	<active/> A 1/0 field indicating if this alert is active.
	<next_seq/> Next sequence number to use.
	<description/> The description of the custom field.
	<force_unique/> A 1/0 field indicating if this field is unique.
	<defnow/> A 1/0 field indicating if date fields default to today.
	<created/> Time the record was created.
	<hint/> The hint used on forms.
	<title/> The title used on forms with this custom field.
	<divider/> A 1/0 field indicating whether to paint a divider.
	<never_copy/> A 1/0 field indicating if the field can be cloned.
	<hidden_data_entry/> A 1/0 field indicating whether the custom
field should be hidden on the data entry UI.
</CustField>

This datatype supports the read and modify XML Commands.

Association table

The CustField datatype uses the following associations. The association is the name of the table that
the custom field is related to. For more information, see association at the following URL: https://
www.openair.com/database/single_user.html#cust_field

<table>
<thead>
<tr>
<th>accounts_payable</th>
<th>event</th>
<th>receiving</th>
</tr>
</thead>
<tbody>
<tr>
<td>agreement</td>
<td>fulfillment</td>
<td>request_item</td>
</tr>
<tr>
<td>attachment</td>
<td>invoice</td>
<td>revenuerecognitionrule</td>
</tr>
<tr>
<td>authorization</td>
<td>item</td>
<td>revenue_container</td>
</tr>
<tr>
<td>authorization_item</td>
<td>issue</td>
<td>revenue_stage</td>
</tr>
<tr>
<td>booking</td>
<td>manufacturer</td>
<td>revenue_recognition_transaction</td>
</tr>
</tbody>
</table>
Customer

Use the Customer datatype for customer, client, or patient information. The customer is the individual or company that is billed or expensed.

```xml
<Customer>
  <id/> Unique ID. Automatically assigned by the system.
  <addr/> The customer’s address.
  <invoice_layoutid/> The ID of the associated invoice layout.
  <rate/> Hourly billing rate for this customer.
  <bus_typeid/> Type of business this customer is in.
  <code/> Optional user-defined code.
  <name/> The nickname used for display in popups and lists.
  <tb_approver/> The user_id of the invoice approver if this is a single approver process. This field is mutually exclusive with tb_approvalprocess.
  If -1 then the approver is the owners manager.
  If -2 then the approver is the owners manager’s manager.
  <territoryid/> The territory for this customer.
  <hierarchy_node_ids/> Comma delimited list - hierarchy nodes this object belongs to.
  <hear_aboutid/> How did they hear about us.
  <statements/> A 1/0 field indicating if this customer can view statements.
  <company_sizeid/> This customer’s company size.
  <web/> Customer’s Web address.
  <currency/> Currency for the money fields in the record. Also the default currency when an invoice is created.
  <cost_centerid/> The ID of the associated cost center.
  <contactaddr/> The contact address for the customer.
  <billingaddr> The billing address for the customer.
  <billing_contact_id/> The billing contact ID.
  <notes/> Notes about the customer.
</Customer>
```
<tb_approvalprocess/> The approvalprocess_id of the invoice approval process. This field is mutually exclusive with tb_approver.
<primary_contactid/> The billing contact ID.
<filterset_ids/> Comma delimited list - filter sets this object belongs to.
<active/> A 1/0 field indicating whether this is designated as an active customer.
<externalid/> If the record was imported from an external system you store the unique external record ID here.
<invoice_prefix/> Text to start every invoice number with.
<type/> A C/P field indicating whether this is Customer or a Prospect.
<userid/> The user ID of the customer or owner.
<terms/> Standard payment terms for the customer. Textual description like Net 30.
<created/> Time the record was created.
<invoice_text/> Text to display on every invoice.
<company/> The company name.
<updated/> Time the record was last updated or modified.
<shipping_contactid/> The shipping contact ID.
<sold_to_contact_id/> The sold to contact ID.
<billing_code/> The customer billing code. Used in bulk invoicing.
<createtime/> Same as the created field (for legacy systems).
<ta_include/> A 1/0 field indicating whether a Timesheet filter set is applied.
<te_include/> A 1/0 field indicating whether an Expense Report filter set is applied.
<updatetime/> Same as the updated field (for legacy systems).
<picklist_label/> Label as shown on form picklist.
</Customer>

This datatype supports the read, add, modify, and delete XML Commands.

**Note:** Refer to the following notes regarding the Customer datatype and fields:

- With the introduction of the `<Contact/>` datatype, the `<billingaddr/>` field for Customer is somewhat obsolete since each customer now has a primary billing contact that is designated in the contact table. The new `<billing_contact_id/>` field for Customer is used to associate a billing contact from the contact table with a customer.
- The `<billingaddr/>` field will continue to be supported for backward compatibility. If you do use `<billingaddr/>` when adding a new customer, not only will it add the customer record, but it will also add a contact record with the same billing information, so you create both a customer and a contact. If you later modify the `<billingaddr/>` of your customer, the contact record will also be modified.
- If you are still using `<billingaddr/>` and want to modify the customer's billing address but not the contact's address, you can do that by setting the "customer_only" attribute in the `<Address/>` to "yes". See the following example:

```
<Modify type="customer">
  <Customer>
    <billingaddr>
      <Address customer_only="yes">
```

XML API Reference Guide
Customerpo

Use the Customerpo datatype to track money through projects and billings.

```xml
<Customerpo>
  <id/> Unique ID. Automatically assigned by the system.
  <number/> The customerpo number.
  <date/> The date of the customerpo.
  <name/> The name of the customerpo.
  <active/> A 1/0 field indicating whether this is an active customerpo.
  <externalid/> If the record was imported from an external system you store the unique external record id here.
  <total/> The customerpo total. Dated by the date field.
  <created/> Time the record was created.
  <currency/> Currency for the money fields in the record.
  <notes/> Notes.
  <customerid/> The ID of the associated customer.
  <customer_externalid/> The external ID for the associated customer.
  <updated/> Time the record was last modified.
  <code/> Optional accounting system code for integration with external accounting systems.
  <acct_date/> The accounting period date of the customerpo.
  <picklist_label/> Label as shown on form picklist.
</Customerpo>
```

This datatype supports the read, add, modify, and delete XML Commands.

Customerpo_to_project

Use the Customerpo_to_project datatype to create a many-to-many link between projects and customers.

```xml
<Customerpo_to_project>
  <id/> Unique ID. Automatically assigned by the system.
  <customerpoid/> The ID of the associated customerpo.
  <created/> Time the record was created.
  <customerid/> The ID of the associated customer.
  <active/> A 1/0 field indicating whether this is an active customerpo.
  <updated/> Time the record was last modified.
  <projectid/> The ID of the associated project.
</Customerpo_to_project>
```
If the record was imported from an external system, you store the unique external record ID here.

This datatype supports the read, add, and modify XML Commands.

**CustomerProspect**

Use the CustomerProspect datatype to specify information about prospective customers or clients. The field names and definitions are similar to those associated with Customer datatype.

```xml
<CustomerProspect>
  <id/> Unique ID. Automatically assigned by the system.
  <addr/> The prospective customer's address.
  <invoice_layoutid/> The ID of the associated invoice layout.
  <rate/> Hourly billing rate for this prospective customer.
  <bus_typeid/> Type of business this prospective customer is in.
  <code/> Optional user-defined code.
  <tb_approver/> The user_id of the invoice approver if this is a single approver process. This field is mutually exclusive with tb_approvalprocess. If -1 then the approver is the owners manager and if -2 then the approver is the owners manager's manager.
  <territoryid/> The territory for this prospective customer.
  <name/> The nickname used for display in popups and lists.
  <hierarchy_node_ids/> Comma delimited list - hierarchy nodes this object belongs to.
  <hear_aboutid/> How did they hear about us.
  <statements/> A 1/0 field indicating if this prospective customer can view statements.
  <company_sizeid/> This prospective customer's company size.
  <web/> Prospective customer's Web address.
  <currency/> Currency for the money fields in the record. Also the default currency when an invoice is created.
  <cost_centerid/> The ID of the associated cost center.
  <contactaddr/> The contact address for the prospective customer.
  <billingaddr> The billing address for the prospective customer.
  <billing_contact_id/> The billing contact ID.
  <notes/> Notes about the prospective customer.
  <tb_approvalprocess/> The approvalprocess_id of the invoice approval process. This field is mutually exclusive with tb_approver.
  <primary_contactid/> The billing contact ID.
  <filterset_ids/> Comma delimited list - filter sets this object belongs to.
  <active/> A 1/0 field indicating whether this is designated as an active customer.
  <externalid/> If the record was imported from an external system you store the unique external record ID here.
  <invoice_prefix/> Text to start every invoice number with.
  <type/> A C/P field indicating whether this is Customer or a Prospect.
  <userid/> The user ID of the prospective customer or owner.
  <terms/> Standard payment terms for the prospective customer.
</CustomerProspect>
```
This datatype supports the read, add, modify, and delete XML Commands. When doing a <Read/> with CustomerProspect as the datatype, both customer and prospect records are returned.

Date

Use the Date datatype to specify date information. The correct value format is a four-digit number for year and a two-digit number for all other fields.

Deal

Use the Deal datatype to specify a potential sale to a prospect or customer. A deal can also be associated with a contact, an estimate, a todo, or an event.
Deal

When this deal was first opened.

Notes for this deal.

The ID of the associated customer.

Date and time the record was marked as exported.

Time the record was last updated or modified.

</Deal>

This datatype supports the read XML Commands.

Dealcontact

Use the Dealcontact datatype to specify contact information for a deal.

<Dealcontact>
    <id/> Unique ID. Automatically assigned by the system.
    <created/> Time the record was created.
    <contactid/> The related contact.
    <dealid/> The deal ID.
    <updated/> Time the record was last updated or modified.
</Dealcontact>

This datatype supports the read XML Commands.

Dealschedule

Use the Dealschedule datatype to specify schedule information for a deal. A deal, among other things, consists of a total deal amount and a potential closing date. However, this total amount can be broken down into smaller portions, each with its own potential closing date. A dealschedule is one of these smaller amount portions, and is associated with a particular deal.

<Dealschedule>
    <id/> Unique ID. Automatically assigned by the system.
    <created/> Time the record was created.
    <amount/> The amount this portion of the deal is worth (in the currency of the deal). Dated by the date/> field.
    <dealid/> ID of the deal associated with this deal portion.
    <date/> The potential closing date for a deal portion.
    <updated/> Time the record was last updated or modified.
</Dealschedule>

This datatype supports the read XML Commands.

Department

Use the Department datatype to specify department information and associate a user with a department.

<Department>
    <id/> Unique ID. Automatically assigned by the system.
    <created/> Time the record was created.
    <userid/> The user ID of the head of the department.
</Department>
This datatype supports the read, add, modify, and delete XML Commands.

**Entitytag**

Use the Entitytag datatype to specify entity tag information.

```xml
<Entitytag>
    <id/> Unique ID. Automatically assigned by the system.
    <default_for_entity/> A 1/0 field indicating whether this is the default row for this entity.
    <userid/> The ID of the associated user.
    <projectid/> The ID of the associated project.
    <created/> Time the record was created.
    <tag_group_attributeid/> The ID of the associated tag_group_attribute.
    <end_date/> End date for this entity_tag.
    <customerid/> The ID of the associated customer.
    <updated/> Time the record was last updated or modified.
    <start_date/> Start date for this entity_tag.
    <tag_group_attribute_name/> The name of the associated tag group attribute.
    <tag_group_id/> The ID of the associated tag group attribute.
</Entitytag>
```

This datatype supports the read, add, modify, and delete XML Commands.

**Note:** You can use Entitytags in a special way with the read command. Refer to the following examples:

<table>
<thead>
<tr>
<th>Example</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>tag_with_name=&quot;1&quot;</code></td>
<td>attribute to return the name</td>
</tr>
<tr>
<td><code>between_date='2008-07-01'</code></td>
<td>attribute specifies the date for which to retrieve the current entity tag record</td>
</tr>
<tr>
<td><code>between_date='0000-00-00'</code></td>
<td>returns all entries with no start and no end dates</td>
</tr>
</tbody>
</table>

**Envelope**

Use the Envelope datatype to specify information about tickets in an envelope. Envelopes are used to group individual receipts into an expense report.

```xml
<Envelope>
    <id/> Unique ID. Automatically assigned by the system.
    <totreimburse/> The total amount of reimbursable expenses in the
</Envelope>
```
This datatype supports the read, add, modify, submit, approve, reject, unapprove, and delete XML Commands.

**Note:** There is an OpenAir internal switch that can be enabled to allow API editing of approved expense reports. To use this feature, open a support ticket and request that the following switch be enabled: API will allow editing of approved Expense reports. See Troubleshooting for instructions on how to create a support ticket.

## Error

Use the Error datatype to specify information about an error.

```xml
<Error>
    <comment/> Additional comments.
    <text/> Text of the error.
    <code/> Error code returned by the API.
</Error>
```
This datatype supports the read XML Commands.

**Estimate**

Use the Estimate datatype to specify estimate records for staffing, fixed costs, and discounts. It is used to create profit margin estimates for deals that are in the pipeline.

```xml
<Estimate>
  <id/> Unique ID. Automatically assigned by the system.
  <hide_expense/> A 1/0 field indicating if expenses should be hidden in analysis report.
  <dealid/> The ID of the associated deal.
  <name/> The short description for the estimate.
  <created/> Time the record was created.
  <notes/> Notes about the estimate.
  <customerid/> The ID of the associated customer.
  <updated/> Time the record was last updated or modified.
</Estimate>
```

This datatype supports the read XML Commands.

**Estimateadjustment**

Use the Estimateadjustment datatype to specify estimate adjustment records. Estimate adjustments are the adjustment records associated with particular estimates.

```xml
<Estimateadjustment>
  <id/> Unique ID. Automatically assigned by the system.
  <created/> Time the record was created.
  <amount/> The amount of adjustment in money (in the currency of the estimate) or percentage of total expense or labor. The actual type is identified by amount_type field.
  <estimateid/> The ID of the associated estimate.
  <name/> The name for the estimate adjustment.
  <updated/> Time the record was last updated or modified.
  <adjustment_type/> A 1/0 field indicating the adjustment is for labor or expenses. If 1 - then adjustment is for labor. If 0 - then adjustment is for expenses.
  <amount_type/> A 1/0 field indicating the type of the amount field. If 1 - then amount field represents percentage of time. If 0 - then amount field represents number of hours.
</Estimateadjustment>
```

This datatype supports the read XML Commands.

**Estimateexpense**

Use the Estimateexpense datatype to specify estimate expense records.
<Estimateexpense>
   <id/> Unique ID. Automatically assigned by the system.
   <estimateid/> The ID of the associated estimate.
   <itemid/> The ID of the associated expense item.
   <date/> Date for the expense.
   <markup_type/> A 1/0 field indicating the type of expense markup. If 1 - then use percentage of the cost. If 0 - then use the specific amount.
   <quantity/> The quantity for the expense.
   <description/> The short description for the estimate.
   <created/> Time the record was created.
   <phaseid/> The ID of the associated estimate phase.
   <markup/> The amount of markup in percent or money as designated by markup_type field. Dated by the date field.
   <price/> The cost of the expense. Dated by the date field.
   <updated/> Time the record was last updated or modified.
</Estimateexpense>

This datatype supports the read XML Commands.

Estimatelabor

Use the Estimatelabor datatype to specify estimate staffing records.

<Estimatelabor>
   <id/> Unique ID. Automatically assigned by the system.
   <estimateid/> The ID of the associated estimate.
   <loaded_cost/> The loaded cost for the associated resource. Dated by the start_date field.
   <userid/> The ID of the associated resource.
   <description/> The short description for the estimate.
   <amount_type/> A 1/0 field indicating the type of the amount field. If 1 - then amount field represents percentage of time. If 0 - then amount field represents number of hours.
   <created/> Time the record was created.
   <amount/> The number of hours or percentage of time associated with a given resource for a specific phase of an estimate. The actual type is identified by as_percentage field.
   <phaseid/> The ID of the associated estimate phase.
   <end_date/> End date for resource assignment.
   <billing_rate/> The billing rate for the associated resource. Dated by the start_date field.
   <start_date/> Start date for resource assignment.
   <updated/> Time the record was last updated or modified.
</Estimatelabor>

This datatype supports the read XML Commands.

Estimatemarkup

Use the Estimatemarkup datatype to specify information about phases for the estimate.
<Estimatemarkup>
  <id/> Unique ID. Automatically assigned by the system.
  <estimateid/> The ID of the associated estimate.
  <percent/> The percentage markup to add to the total expense amount.
  <total/> The amount of expense (in the currency of the estimate) to use for this estimate in calculations.
  <created/> Time the record was created.
  <phaseid/> The ID of the associated estimate phase.
  <updated/> Time the record was last updated or modified.
  <as_percentage/> A 1/0 field indicating which expense markup to use: If 1 - then use percentage of the total, compute total markup. If 0 - then use the specific amount, compute percent markup.
</Estimatemarkup>

This datatype supports the read XML Commands.

Estimatephase

Use the Estimatephase datatype to specify information about phases for the estimate.

<Event>
  <id/> Unique ID. Automatically assigned by the system.
  <contact_id/> The ID of the associated contact.
  <userid/> The ID of the user who created the event.
  <dealid/> The ID of the associated deal.
  <name/> The name or description of the event.
  <occurred/> The date of the event.
  <created/> Time the record was created.
  <notes/> Notes related to the event.
  <updated/> Time the record was last updated or modified.
  <customerid/> The id of the associated customer.
</Event>

This datatype supports the read XML Commands.
This datatype supports the read, add, and modify XML Commands.

**ExpensePolicy**

Use this datatype to specify information about expense policies.

```xml
<ExpensePolicy>
  <id/> Unique ID. Automatically assigned by the system.
  <customerid/> The ID of the associated customer.
  <projectid/> The ID of the project which expense policy is associated to. If zero/null then this is company default expense policy.
  <description/> Optional information about expense policy.
  <deleted/> A "1/0" field indicated if the record was deleted.
  <created/> Time the record was created.
  <updated/> Time the record was last modified.
  <all_items_allowed/> A "1/0" field indicating that all expense items are allowed by this expense policy.
</ExpensePolicy>
```

This datatype supports the read, add, modify, and delete XML Commands.

**ExpensePolicyItem**

Use this datatype to specify information about items allowed for an expense policy.

```xml
<ExpensePolicyItem>
  <id/> Unique ID. Automatically assigned by the system.
  <expense_policyid/> The ID of the expense policy which this item belongs to.
  <itemid/> The ID of the expense policy which this item belongs to.
  <price_max/> If set, this item has a defined maximum price.
  <price_fixed/> If set, this item has a defined fixed price which cannot be overridden in the ticket form.
  <currency/> Currency of fixed/max price.
  <deleted/> A "1/0" field indicating if the record was deleted.
  <created/> Time the record was created.
  <updated/> Time the record was last modified.
</ExpensePolicyItem>
```

This datatype supports the read, add, modify, and delete XML Commands.

**Filter**

Use the Filter datatype to limit the user to a subset of a certain kind of account data.

For more information on it's use, refer to the Read, all command. Currently, only the customer list can be filtered, using the type Customer as an attribute of the <Filter/> datatype. Refer to the following example:

```xml
<Filter type="customer"/>
```
 Filterset

Use the Filterset datatype to list names and IDs that define the table/id pairs to be filtered for each filterset.

```
<Filterset>
  <id/> Unique ID. Automatically assigned by the system.
  <name/> The name of the filterset.
  <notes/> Notes related to the filterset.
  <all_access/> A 1/0 field indicating this filterset does not filter anything and can not be deleted.
  <default_filter_set/> A 1/0 field indicating whether this is the default new-user filterset.
  <active/> A 1/0 field indicating whether this is designated as an active filter set.
  <externalid> If the record was imported from an external system you store the unique external record id here.
  <created/> Time the record was created.
  <updated/> Time the record was last updated or modified.
</Filterset>
```

This datatype supports the read XML Commands.

Flag

Use the Flag datatype to customize the appearance of the product using switches and settings.

```
<Flag>
  <id/> Unique ID. Automatically assigned by the system.
  <name/> The name of the switch.
  <setting/> The value to which the switch is set.
</Flag>
```

This datatype supports the read, add, and modify XML Commands. Also refer to the Company and User datatypes.

ForexInput

Use the ForexInput datatype to allow multi-currency accounts to override historical and future currency conversion rates.

```
<ForexInput>
  <symbol/> Currency symbol. Must be for one of the multiple currencies enabled in the account.
  <startdate/> Optional start date for currency being set.
  <enddate/> Optional end date for currency being set.
</ForexInput>
```
ForexInput

This datatype supports the read, add, and modify XML Commands.

**Note:** There is an OpenAir internal switch that allows you to specify the rate against a user-defined currency. To use this feature, open a support ticket and request that the following switch be enabled: Enable user defined reporting currencies. See Troubleshooting for instructions on how to create a support ticket.

FormPermissionField

This datatype is for internal use only.

Fulfillment

Use the Fulfillment datatype to specify information about the receipt of goods and services ordered by a purchase order.
Fulfillment

- `<purchase_item_id/>` Associated purchase item ID.
- `<waybill_number/>` The waybill number.
- `<date/>` Date of the fulfillment.
- `<acct_date/>` The accounting period date of the fulfillment.
- `<quantity/>` The quantity received.
- `<notes/>` Fulfillment description notes.
- `<created/>` Time the record was created.
- `<updated/>` Time the record was last updated or modified.

This datatype supports the read XML Commands.

**Hierarchy**

Use the Hierarchy datatype to specify hierarchy information.

- `<id/>` Unique ID. Automatically assigned by the system.
- `<created/>` Time the record was created.
- `<requireonform/>` A 1/0 field indicating whether this hierarchy should be added to the object type form.
- `<name/>` The hierarchy name.
- `<active/>` A 1/0 field indicating whether this is designated as an active hierarchy.
- `<updated/>` Time the record was last updated or modified.
- `<required/>` A 1/0 field indicating whether this hierarchy should be a required element on the object type form.
- `<notes/>` Notes related to the hierarchy.
- `<available_as_column/>` A 1/0 field indicating whether this hierarchy is available as a (customer, project or user) list column. Only one hierarchy per type can be displayed as a column in a list.
- `<externalid/>` If the record was imported from an external system, you store the unique external record ID here.
- `<primary_dropdown_filter/>` A 1/0 field indicating whether this hierarchy is used as a drop-down filter.
- `<primary_user_filterset/>` A 1/0 field indicating whether this hierarchy determines filter set access for projects.
- `<type/>` The type (table name) of the hierarchy: customer, project, or user.

This datatype supports the read, add, and modify XML Commands.

**HierarchyNode**

Use the HierarchyNode datatype to specify information about a hierarchy node.

- `<id/>` Unique ID. Automatically assigned by the system.
<HierarchyNode>
  <hierarchyid/> The ID of the associated hierarchy.
  <levelid/> The id of the associated hierarchy level.
  <isalevel/> A 1/0 field indicating if this node is a level.
  <created/> Time the record was created.
  <recordid/> The record ID if not a node.
  <name/> The hierarchy name.
  <isanode/> The name of the hierarchy node.
  <updated/> Time the record was last updated or modified.
  <parentid/> The hierarchy_node id of our immediate ancestor. If zero/null, is a top-level node.
  <externalid/> If the record was imported from an external system, you store the unique external record ID here.
  <notes/> Notes related to the hierarchy node.
</HierarchyNode>

This datatype supports the read, add, modify, and delete XML Commands.

**History**

Use the History datatype to specify history events.

<History>
  <id/> Unique ID. Automatically assigned by the system.
  <created/> Time the record was created.
  <userid/> The ID of the user associated with this history event.
  <notes/> Notes associated with the history event.
  <envelopeid/> The ID of the associated envelope.
  <date/> The date associated with this history event.
  <action/> The approval action: S - Submittal, P - Pending, A - Acceptance, R - Rejection, U - Unapproval.
</History>

This datatype only supports the Read, equal to command.

**ImportExport**

Use the ImportExport datatype to specify table and id pairs corresponding to an external application. It can be used in conjunction with read, all and the not-exported filter to request records that have not been exported.

<ImportExport>
  <id/> Internal ID of the actual record (slip, task, etc.) in its native table.
  <application/> String describing the application making the association.
  <exported/> Time of the last export from OpenAir. Required on import.
  <type/> XML Datatype name of the exported record: Slip, Task, Projectassign, etc. Please note that these names are case sensitive.
  <externalid/> External identifier for the application.
</ImportExport>
This datatype supports the read, add, modify, and delete XML Commands.

Invoice

Use the Invoice datatype to specify invoice information for the header.

```
<Invoice>
    <id/> Unique ID. Automatically assigned by the system.
    <created/> Time the record was created.
    <draw_date/> The date of the draw.
    <number/> The invoice number.
    <status/> The status of the invoice (EZ Invoice, emailed Invoice): 0 - Unknown, 1 - Not Sent, 2 - Viewed, 3 - EZ Requested, 4 - Rejected, 5 - Sent, 6 - EZ Sent, and 7 - Retracted.
    <date/> The date of the invoice.
    <terms/> Payment terms for this invoice.
    <invoice_layoutid/> The ID of the associated invoice layout.
    <credit_reason/> The reason for the credit.
    <currency/> The currency this invoice is in.
    <tax_state/> The state tax total for the invoice. Dated by the date field.
    <tax_federal/> The federal tax total for the invoice. Dated by the date field.
    <tax_gst/> The GST tax for the invoice. Dated by the date field.
    <emailed/> Date the user emailed the invoice. For invoices created before this field existed, this field is set to 1970-01-01 to flag it as an unknown value.
    <tax_pst/> The PST tax for the invoice. Dated by the date field.
    <draw/> The amount of any draw against retainer for this invoice. Dated by the draw_date field.
    <contactid/> The contact id for this invoice.
    <shipping_contactid/> The shipping contact id for this invoice.
    <approval_status/> The approval status of the invoice, only used if invoice approvals are used: O - Open, S - Submitted, A - Approved, and R - Rejected.
    <access_log/> The mailing and access history of the invoice, such as when the customer accessed it.
    <credit/> The amount of any credit against the invoice. Dated by the date field.
    <tax_hst/> The HST tax for the invoice. Dated by the date field.
    <tax/> The tax total for the invoice. Dated by the date field.
    <total/> The invoice total. Dated by the date field.
    <updated/> Time the record was updated.
    <balance/> The outstanding balance on the invoice. Dated by the date field.
    <notes/> Notes associated with the invoice.
    <paperrequest/> Date the user requested that a paper invoice be
```
<Invoice>
    <customerid/> The id of the associated customer.
    <accounting/> A 1/0 field indicating if an invoice has been sent to an accounting partner.
    <papersend/> Date the paper invoice was actually mailed.
    <acct_date/> The accounting period date of the invoice.
    <externalid/> If the record was imported from an external system, you store the unique external record ID here.
    <credit_rebill_status/> Credit/Rebill status for the original invoice: C = Credit Initiated and R = Re-Bill.
    <original_invoiceid/> The original invoice ID for credit invoices.
    <attachmentid/> The ID of the associated attachment.
</Invoice>

This datatype supports the read, add, modify, submit, approve, reject, unapprove, and delete XML Commands.

**Note:** If not all invoices are returned from an API request, determine whether the following OpenAir internal switch is enabled: API will allow editing of approved Invoices. Speak with your Professional Services Consultant or create a support ticket. See Troubleshooting for instructions on creating a support ticket.

### InvoiceLayout

Use the InvoiceLayout datatype to read invoice layout information.

```xml
<InvoiceLayout>
    <id/> Unique ID. Automatically assigned by the system.
    <name/> The name used for display in popups and lists.
    <created/> Created Time the record was created.
    <updated/> Updated Time the record was last modified.
</InvoiceLayout>
```

This datatype supports the read XML Commands.

### Issue

Use the Issue datatype to specify issue information.

```xml
<Issue>
    <id/> Unique ID. Automatically assigned by the system.
    <created/> Time the record was created.
    <number/> The issue number that increments by 1.
    <prefix/> A static alphanumeric issue number prefix.
    <name/> The name of the issue (Prefix + number).
    <owner_id/> The ID of the associated user creating the issue.
    <description/> A short description of the issue, a synopsis.
    <customer_id/> The ID of the associated customer.
    <project_id/> The ID of the associated project.
    <project_task_id/> The ID of the task within the associated
</Issue>
```
<Issue>
  <issue_category_id/> The ID of the associated issue category.
  <issue_status_id/> The ID of the associated issue status.
  <issue_stage_id/> The ID of the associated issue stage.
  <issue_severity_id/> The ID of the associated issue severity.
  <issue_source_id/> The ID of the associated issue source.
  <issue_notes/> The description of the issue.
  <resolution_notes/> The description of the resolution.
  <date/> The date of the issue.
  <date_resolution_required/> The date the issue must be resolved.
  <date_resolution_expected/> The date the issue is expected to be resolved.
  <date_resolved/> The date the issue was resolved.
  <user_id/> The ID of the user assigned to the issue.
  <priority/> The priority of the task (1 - 100).
  <attachment_id/> If non-zero, the attachment record associated with this issue.
  <updated/> Time the record was updated.
  <submitted/> Date the invoice was submitted.
  <approved/> Date the invoice was approved.
</Issue>

This datatype supports the read, add, modify, and delete XML Commands.

**IssueCategory**

Use the IssueCategory datatype to specify information about the issue category.

```xml
<IssueCategory>
  <id/> Unique ID. Automatically assigned by the system.
  <created/> Time the record was created.
  <name/> The name of the issue category.
  <active/> A 1/0 field indicating whether this issue category is active.
  <notes/> Notes associated with the issue category.
  <updated/> Time the record was last updated or modified.
</IssueCategory>
```

This datatype supports the read, add, and modify XML Commands.

**IssueSeverity**

Use the IssueSeverity datatype to specify information about the issue severity.

```xml
<IssueSeverity>
  <id/> Unique ID. Automatically assigned by the system.
  <created/> Time the record was created.
  <name/> The name of the issue severity.
  <active/> A 1/0 field indicating whether this issue severity is active.
  <notes/> Notes associated with the issue severity.
</IssueSeverity>
```
IssueSeverity

This datatype supports the read, add, and modify XML Commands.

IssueSource

Use the IssueSource datatype to specify information about the issue source.

```xml
<IssueSource>
  <id/> Unique ID. Automatically assigned by the system.
  <created/> Time the record was created.
  <name/> The name of the issue source.
  <active/> A 1/0 field indicating whether this issue source is active.
  <notes/> Notes associated with the issue source.
  <updated/> Time the record was last updated or modified.
</IssueSource>
```

This datatype supports the read, add, and modify XML Commands.

IssueStage

Use the IssueStage datatype to specify information about the issue stage.

```xml
<IssueStage>
  <id/> Unique ID. Automatically assigned by the system.
  <created/> Time the record was created.
  <name/> The name of the issue stage.
  <default_for_new/> A 1/0 field indicating whether this is the default stage for new issues.
  <considered_closed/> A 1/0 field indicating whether issues in this stage are considered closed.
  <position/> The position of the stage.
  <notes/> Notes associated with the issue stage.
  <updated/> Time the record was last updated or modified.
</IssueStage>
```

This datatype supports the read, add, and modify XML Commands.

IssueStatus

Use the IssueStatus datatype to specify information about the issue status.

```xml
<IssueStatus>
  <id/> Unique ID. Automatically assigned by the system.
  <name/> The name of the issue status.
  <active/> A 1/0 field indicating if this issue status is active.
  <created/> Time the record was created.
</IssueStatus>
```
This datatype supports the read, add, and modify XML Commands.

**Item**

Use the Item datatype to specify item information such as an expense item, expense type, expense, and inventory item.

```xml
<Item>
    <id/> Unique ID. Automatically assigned by the system.
    <created/> Time the record was created.
    <cost/> The default cost per unit of measure for the item. 3 decimal places to handle items like mileage at 32.5 cents.
    <active/> A 1/0 field indicating whether this is designated as an active customer.
    <taxable/> A 1/0 field indicating whether this item is taxable, VAT-able, etc.
    <externalid/> If the record was imported from an external system you store the unique external record ID here.
    <unitm/> The unit of measure for the item, i.e., EA.
    <currency/> Currency for the money fields in the record.
    <cost_centerid/> The id of the associated cost center.
    <name/> The item name.
    <type/> The type of item. Add new types when type-specific information can be captured for the slip or ticket templated from this item: R - for regular item and M - for mileage item.
    <code/> Optional accounting system code for integration with external accounting systems.
    <updated/> Time the record was last updated or modified.
    <tp_cost/> The policy threshold amount.
    <tp_comp/> Ticket policy comparison:
    ge - greater than or equal to
    gt - greater than
    <tp_notes_required/> Notes are required if the ticket triggers the policy.
    <tax_location_id/> The ID of the associated tax location.
    <tp_unit_or_total/> The ticket policy is applied against:
    U - Unit price
    T - Total
    <cost_is_fixed/> A 1/0 field indicating whether the user is allowed to change the cost on a receipt
    <picklist_label/> Label as shown on form picklist.
</Item>
```

This datatype supports the read, add, modify, and delete XML Commands.

**ItemToUserLocation**

Use the ItemToUserLocation datatype to specify associations between Item, UserLocation, and TaxLocation.
<ItemToUserLocation>
  <id/> Unique ID. Automatically assigned by the system.
  <itemid/> The ID of the associated item.
  <tax_locationid/> The ID of the associated tax location.
  <user_locationid/> The location ID for this user.
  <created/> Time the record was created.
  <updated/> Time the record was last updated or modified.
</ItemToUserLocation>

This datatype supports the read, add, modify, and delete XML Commands.

**Jobcode**

Use the Jobcode datatype to specify job code information.

<Jobcode>
  <id/> Unique ID. Automatically assigned by the system.
  <created/> Time the record was created.
  <userid_fte/> The user ID of the FTE (Full Time Equivalent) generic resource.
  <loaded_cost/> Loaded cost for this job code.
  <name/> The name for the job code.
  <updated/> Time the record was last updated or modified.
  <notes/> Notes associated with the job code.
  <externalid/> If the record was imported from an external system you store the unique external record id here.
  <currency/> Currency for the money fields in the record.
  <code/> Optional accounting system code for integration with external accounting systems.
  <active/> A 1/0 field indicating if this is an active job code.
</Jobcode>

This datatype supports the read, add, and modify XML Commands.

**Leave_accrual_rule**

Use the Leave_accrual_rule datatype to specify leave accrual rule information.

<Leave_accrual_rule>
  <id/> Unique ID. Automatically assigned by the system.
  <created/> Time the record was created.
  <project_task_filter/> CSV list of project_tasks that will trigger a draw down.
  <category_filter/> CSV list of categories that will trigger a draw down.
  <lose_how/> How is accrued time lost: N - Never, A - The users anniversary date, and Y - End of year.
  <cap/> Number of hours to cap the accrual at.
  <timetype_filter/> CSV list of timetypes that will trigger a draw down.
  <project_filter/> CSV list of projects that will trigger a draw...
Leave accrual_rule

<period/> The period for the cap.
<draw_down_when/> Generate the draw down when: R - When leave accrual is run or A - When a timesheet is approved.
<notes/> Notes associated with the leave accrual rule.
<active/> A 1/0 field indicating whether this is an active billing rule.
<name/> The name for the leave accrual rule.
<updated/> Time the record was last updated or modified.
<grace_days/> How many days is the grace period before accrued time is lost.
<timing/> When the accrual is applied: S - start of the period or E - end of the period.
<amount/> The number of hours per period.
</Leave_accrual_rule/>

This datatype supports the read, add, and modify XML Commands.

Leave_accrual_rule_to_user

Use the Leave_accrual_rule_to_user datatype to map leave accrual rules to users.

<Leave_accrual_rule_to_user>
  <id/> Unique ID. Automatically assigned by the system.
  <created/> Time the record was created.
  <userid/> The id of the associated user.
  <end_date/> The date the accrual rule stops applying to the user.
  <start_date/> The date the accrual rule starts applying to the user. This is required.
  <updated/> Time the record was last updated or modified.
  <transfer_balance_to/> ID of leave_accrual_rule_to_user record where balance should be transferred to.
  <leave_accrual_ruleid/> The id of the associated accrual rule.
</Leave_accrual_rule_to_user>

This datatype supports the read, add, and modify XML Commands.

Leave_accrual_transaction

Use the Leave_accrual_transaction datatype to specify leave accrual transaction information.

<Leave_accrual_transaction>
  <id/> Unique ID. Automatically assigned by the system.
  <created/> Time the record was created.
  <date/> The date of the transaction.
  <taskid/> The id of the associated task if this is a draw down against a timesheet entry.
  <notes/> Notes associated with the leave accrual transaction.
  <updated/> Time the record was last updated or modified.
  <amount/> The number of hours. A draw down must be a negative number. An accrual is typically a positive number but can be a negative number.
</Leave_accrual_transaction>
<type/> Indicates type of draw down: the type of the amount field. D - draw down or A - Accrual.
<from_run/> Indicates if this was generated from a run the leave accrual rules.
.userid/> The ID of the associated user.
<leave_accrual_ruleid/> The ID of the associated accrual rule. This is a required field.
</Leave_accrual_transaction>

This datatype supports the read, add, and modify XML Commands.

**LoadedCost**

Use the LoadedCost datatype to specify loaded cost values for a user.

<LoadedCost>
  <id/> Unique ID. Automatically assigned by the system.
  <created/> Time the record was created.
  <userid/> ID of the user.
  <projectid/> The id if this loaded cost is associated with a specific project.
  <externalid/> If the record was imported from an external system you store the unique external record ID here.
  <end/> End date for the loaded cost for historical records.
  <updated/> Time the record was last updated or modified.
  <currency/> The currency of the cost field.
  <customerid/> The ID of the associated customer.
  <current/> A 1/0 field indicating if this is the current loaded cost record.
  <project_taskid/> The id if this loaded cost is associated with a specific project task. If this field is used, the project_id and customer_id must be empty.
  <cost/> The fully loaded hourly cost of the user.
  <start/> Start date for the loaded cost for historical records.
  <lc_level/> If multiple loaded costs are used, this holds the level of loaded cost:
    0 - primary loaded cost
    1 - secondary loaded cost
    2 - tertiary loaded cost
</LoadedCost>

This datatype supports the read, add, and modify XML Commands.

**Login**

Use the Login datatype to authenticate a user into an account. Many commands require a valid <Auth/>, and hence a <Login/> before being executed. They include the read, modify, submit, and delete commands.

>Login>
  <company/> The nickname of the company.
  <user/> The nickname of the user.
</Login>

XML API Reference Guide
<Login>
  The password for the user.
</Login>

Module
Use the Module datatype to specify Module availability.

<Module>
  <abbr/> Abbreviation within OpenAir.
  <enabled/> A 1/0 field indicating whether the module is enabled.
</Module>

This datatype supports the read XML Commands.

Notes
Use the Notes datatype to store partner-specific information on the OpenAir system. You might store partner-specific preferences. Refer to the following example:

<Notes>
  <name/> Name.
  <user_id/> ID of the user.
  <setting/> Setting information.
  <created/> Time the record was created.
  <updated/> Time the record was last modified.
</Notes>

This datatype supports the read, add, modify, and delete XML Commands.

Newsfeed
Use the Newsfeed datatype to specify project status newsfeed data. Refer to the following example:

<Newsfeed>
  <id/> Unique ID. Automatically assigned by the system.
  <created/> Time the record was created.
  <updated/> Time the record was last modified.
</Newsfeed>

This datatype supports the read, add, modify, and delete XML Commands.

NewsfeedMessage
Use the NewsfeedMessage datatype to specify project status newsfeed message data. Refer to the following example:

<NewsfeedMessage>
<id/> Unique ID. Automatically assigned by the system.
<newsfeedid/> The ID of the associated project status newsfeed.
<title/> The title of the newsfeed entry. Limited to 125 characters. Optional.
<content/> The text or HTML content of the newsfeed entry. Limited to 3000 characters. The following HTML tags are allowed (HTML Whitelist): strong, em, u, br, h3, p, ol, ul, li, a, img, span.
<tagid/> The ID of the project status tag.
<created/> Time the record was created. The tagid values correspond to pre-defined project status tags as follows: 0 = Empty (no status); 1 = On Track 2 = Needs Attention; 3 = Off Track; 4 = Proposed; 5 = Not Started; 6 = On Hold; 7 = Completed; 8 = Cancelled.
<authorid/> The ID of the user who created the record.
<updated/> Time the record was last modified.
<editorid/> The ID of the user who last updated or modified the record.
</NewsfeedMessage>

This datatype supports the read, add, modify, and delete XML Commands.

## Payment

Use the Payment datatype to specify payment information.

<Payment>
  <id/> Unique ID. Automatically assigned by the system.
  <created/> Time the record was created.
  <date/> The date of the payment.
  <invoiceid/> The associated invoice ID if a payment against a specific invoice.
  <notes/> Notes associated with the payment.
  <updated/> Time the record was last updated or modified.
  <total/> The payment total. Dated by the date field.
  <invoice_number/> The associated invoice number if a payment against a specific invoice.
  <currency/> Currency for the money fields in the record.
  <customerid/> The ID of the associated customer if this is a retainer payment.
  <bulk_paymentid/> The ID of the bulk_payment transaction if this payment is part of a bulk_payment.
  <externalid/> If the record was imported from an external system you store the unique external record id here.
</Payment>

This datatype supports the read, add, modify, and delete XML Commands.

## Paymentterms

Use the Paymentterms datatype to specify payment terms information.
<Paymentterms>
  <id/> Unique ID. Automatically assigned by the system.
  <created/> Time the record was created.
  <default_terms/> A 1/0 field indicating whether this is the default payment terms (used for Customers, Vendors, Invoices and POs).
  <name/> The payment terms name.
  <notes/> Notes associated with the payment terms.
  <updated/> Time the record was last updated or modified.
  <active/> A 1/0 field indicating where this is designated as an active shipping terms 1/0.
  <default_status/> Default receipt status, e.g. R => Reimbursable, N => Non-reimbursable.
  <default_payment_type/> A "1/0" field indicating whether this is the default payment_type for receipts.
</Paymentterms>

This datatype supports the read, add, and modify XML Commands.

Paymenttype

Use the Paymenttype datatype to specify payment type information. Payment types are used to specify the payment methods for individual receipts.

<Paymenttype>
  <id/> Unique ID. Automatically assigned by the system.
  <created/> Time the record was created.
  <active/> A 1/0 field specifying if the type is active.
  <notes/> Notes associated with the payment type.
  <name/> The name of the payment type.
  <updated/> Time the record was last updated or modified.
  <default_status/> Default receipt status, e.g. R => Reimbursable, N => Non-reimbursable.
  <default_payment_type/> A "1/0" field indicating whether this is the default payment_type for receipts.
</Paymenttype>

This datatype supports the read, add, modify, and delete XML Commands.

Payrolltype

Use the Payrolltype datatype to specify payroll type information.

<Payrolltype>
  <id/> Unique ID. Automatically assigned by the system.
  <created/> Time the record was created.
  <active/> A 1/0 field specifying whether this is an active payroll type.
  <externalid/> If the record was imported from an external system, you store the unique external record ID here.
</Payrolltype>
Payrolltype

<notes/> Notes associated with the payroll type.
<name/> The name of the payroll type.
<updated/> Time the record was last updated or modified.
<picklist_label/> Label as shown on form picklist.
</Payrolltype>

This datatype supports the read, add, modify, and delete XML Commands.

PendingBooking

Use the PendingBooking datatype to read pending booking records.

<PendingBooking>
  <userid/> The ID of the associated user.
  <startdate/> The start date of the booking.
  <repeatid/> The ID of the associated repeating event.
  <booking_typeid/> The ID of the associated booking type.
  <notify_owner/> A 1/0 field indicating whether to send email to the requestor when the booking is modified.
  <date_approved/> The date the booking request was approved.
  <starttime/> Start time.
  <enddate/> The end date of the booking.
  <updated/> Time the record was last updated or modified.
  <endtime/> End time.
  <id/> Unique ID. Automatically assigned by the system.
  <project_taskid/> The ID of the task within the assoc. project.
  <as_percentage/> A 1/0 field indicating which of the fields (hours or percentage) are actual, and which is derived. 1 = percentage is actual and hours is derived. 0 = hours in actual and percentage is derived.
  <date_submitted/> The date the booking_request was submitted.
  <ownerid/> The ID of the associated user creating the booking.
  <hours/> The number of hours booked to this project during this date range. This is either the actual booked hours or derived from the percentage.
  <approval_status/> The approval status of the booking request (O - Open, S - Submitted, A - Approved, R - Rejected).
  <percentage/> The percentage of time booked to this project during this date range. This is either the actual booked percentage or derived from the hours.
  <projectid/> The ID of the associated project.
  <job_code_id/> The ID of the associated job code.
  <externalid/> If the record was imported from an external system you store the unique external record ID here.
  <resource_request_queue_id/> The id of the associated resource request queue.
  <created/> Time the record was created.
  <locationid/> The location ID for this booking.
  <notes/> Booking notes.
  <customerid/> The ID of the associated customer.
  <project_assignment_profile_id/> The id of the associated project assignment profile.
</PendingBooking>
This datatype supports the read XML Commands.

Preference

Use the Preference datatype to specify preference or setting information.

```xml
<Preference>
  <id/> Unique ID. Automatically assigned by the system.
  <created/> Time the record was created.
  <name/> The name for the preference.
  <updated/> Time the record was last updated or modified.
  <group_name/> Optional group name for the preference.
  <userid/> If the preference is for a user, this is the user ID.
  <setting/> The preference data is stored in this field.
</Preference>
```

This datatype supports the read, add, and modify XML Commands.

Product

Use the Product datatype to specify product information. Products are used to create request items, which ultimately appear as line items on purchase orders.

```xml
<Product>
  <id/> Unique ID. Automatically assigned by the system.
  <created/> Time the record was created.
  <manufacturerid/> The manufacturer of this product.
  <um/> The unit of measure for the product, i.e., EA.
  <name/> The name for the product. This shows up on all the product pop-up windows in the application.
  <updated/> Time the record was last updated or modified.
  <currency/> The currency this cost is quoted in.
  <code/> Optional accounting system code for integration with external accounting systems.
  <manufacturer_part/> The manufacturer's part number, SKU or other unique identification for this product.
  <active/> A 1/0 field indicating that this is active.
  <taxable/> A 1/0 field indicating whether this item is taxable.
  <externalid/> If the record was imported from an external system, you store the unique external record id here.
  <vendor_sku/> The preferred vendor's sku for this product.
  <vendor_id/> The preferred vendor from whom to purchase this product.
  <notes/> Notes associated with the product.
  <standard_cost/> The current standard cost per unit of measure for the product. 3 decimal places to handle amounts like mileage at 32.5 cents.
</Product>
```

This datatype supports the read, add, and modify XML Commands.
Project

Use the Project datatype to specify project information and to create one project from another project. Indicate the rules and settings to copy.

```xml
<Project>
  <id/> Unique ID. Automatically assigned by the system.
  <user_filter/> Also allow these users to edit the project if the only_owner_can_edit switch is on.
  <message/> Dashboard message.
  <auto_bill/> A 1/0 field, 1 if the project can be auto-billed.
  <az_approver/> The user_id of the project expense authorization approver if this is a single approver process. This field is mutually exclusive with az_approvalprocess.
    If -1 then the approver is the project owner's manager,
    If -2 then the approver is the project owner's manager's manager,
    If -3 then the approver is the project owner, and
    If -4 then the approver is self.
  <po_approver/> The user_id of the project purchase order approver if this is a single approver process. This field is mutually exclusive with po_approvalprocess.
    If -1 then the approver is the project owner's manager,
    If -2 then the approver is the project owner's manager's manager,
    If -3 then the approver is the project owner, and
    If -4 then the approver is self.
  <auto_bill_cap/> A 1/0 field, 1 if the project should have a cap on auto-billings.
  <invoice_layoutid/> The ID of the associated invoice layout.
  <category_filter/> A category (service) filter. This will hold a list of the categories that are allowed to book time to this project.
  <rate/> The hourly billing rate.
  <notify_assignees/> A 1/0 field indicating whether to send email to assigned users whenever a task in this project is added, modified, or deleted.
  <sync_workspace/> A 1/0 field indicating whether to keep project resources in sync with linked workspace members.
  <notify_owner/> A 1/0 field indicating whether to send email to the project owner when an ownership change is made.
  <br_approvalprocess/> The approvalprocess_id of the project booking request approval process. This field is mutually exclusive with br_approver.
  <te_approver/> The user_id of the project expense report approver if this is a single approver process. This field is mutually exclusive with te_approvalprocess.
    If -1 then the approver is the project owner's manager,
    If -2 then the approver is the project owner's manager's manager,
    If -3 then the approver is the project owner, and
    If -4 then the approver is self.
  <ta_approvalprocess/> The approvalprocess_id of the project timesheet approval process. This field is mutually exclusive with ta_approver.
  <te_approvalprocess/> The approvalprocess_id of the project expense report approval process. This field is mutually exclusive with te_approver.
</Project>
```
The auto-billings cap amount (in the currency of the project).

Time the record was last updated or modified.

Optional system code for integration with external accounting systems.

The user_id of the project invoice approver if this is a single approver process. This field is mutually exclusive with tb_approvalprocess.

If -1 then the approver is the project owner's manager,
If -2 then the approver is the project owner's manager's manager,
If -3 then the approver is the project owner, and
If -4 then the approver is self.

A timetype filter. This will hold a list of the timetypes that are allowed to book time to this project.

Name of the tax location.

A 1/0 field indicating an active project.

The project name. This shows upon all the project pop-up windows in the application.

The ID of the hierarchy node for this project.

If the record was imported from an external system, you store the unique external record ID here.

The approvalprocess_id of the project purchase order approval process. This field is mutually exclusive with po_approver.

The ID of the project stage.

The ID of the associated tax location.

The user_id of the project timesheet approver if this is a single approver process. This field is mutually exclusive with ta_approvalprocess.

If -1 then the approver is the project owner's manager,
If -2 then the approver is the project owner's manager's manager,
If -3 then the approver is the project owner, and
If -4 then the approver is self.

The user_id of the project purchase request approver if this is a single approver process. This field is mutually exclusive with pr_approvalprocess.

If -1 then the approver is the project owner's manager,
If -2 then the approver is the project owner's manager's manager,
If -3 then the approver is the project owner, and
If -4 then the approver is self.

The location ID for this project (DEPRECATED).

The calculated finish date of the project.

If imported from Microsoft project, this field describes the state:

"" not imported from MSP, 'I' imported and locked for edit, 'U' imported but unlocked for edit.

The ID of the associated customer.

The customer's name.

A 1/0 field indicating whether only the project owner can edit this project.

The user_id of the project booking request approver if this is a single approver process. This field is mutually exclusive with br_approvalprocess.

If -1 then the approver is the project owner's manager,
If -2 then the approver is the project owner’s manager’s manager,
If -3 then the approver is the project owner, and
If -4 then the approver is self.

- `<userid/>` The user ID of the project owner.
- `<az_approvalprocess/>` The approvalprocess_id of the project
  expense authorization approval process. This field is mutually
  exclusive with az_approver.
- `<project_locationid/>` The location ID for this project.
- `<budget/>` The budgeted revenue for the project.
- `<currency/>` Currency for the money fields in the record.
- `<cost_centerid/>` The ID of the associated cost center.
- `<sga_labor/>` The allocated cost (SG and A) overhead percentage
  to apply to labor for profitability analysis.
- `<invoice_text/>` Text to display on every invoice.
- `<budget_time/>` The budgeted amount of time for the project, in
  hours.
- `<start_date/>` The scheduled starting date of the project.
- `<pr_approvalprocess/>` The approvalprocess_id of the project
  purchase request approval process. This field is mutually
  exclusive with pr_approver.
- `<billing_contactid/>` The billing contact ID if different than
  the customer designated billing contact.
- `<billing_code/>` The project billing code. Used in bulk
  invoicing.
- `<created/>` Time the record was created.
- `<no_dirty/>` A 1/0 field, 1 if we want this project to be marked
  dirty when it has finished the current recalc.
- `<notes/>` Notes associated with this project.
- `<create_workspace/>` A 1/0 field, 1 if an associated workspace is
  automatically created by the API. The project owner becomes the
  workspace owner.
- `<tb_approvalprocess/>` The approvalprocess_id of the project
  invoice approval process. This field is mutually exclusive with
  tb_approver.
- `<auto_bill_override/>` A 1/0 field, 1 if the project overrides
  the global auto_billing settings. The auto_bill table will hold
  the settings for the project.
- `<template_project_id/>` ID of the project from which tasks and
  phases, billing rules, revenue recognition rules and other items
  will be copied.
- `<copy_revenue_recognition_rules/>` Duplicates revenue recognition
  rules.
- `<copy_revenue_recognition_auto_settings/>` Duplicates revenue
  recognition rules auto-run settings.
- `<copy_project_billing_rules/>` Duplicates project billing rules.
- `<copy_project_billing_auto_settings/>` Duplicates project autobill
  settings.
- `<copy_project_pricing/>` Duplicates project pricing information.
- `<copy_custom_fields/>` Duplicates custom fields.
- `<copy_loaded_cost/>` Duplicates project pricing information.
- `<copy_approvers/>` Duplicates project approvers.
- `<copy_issues/>` Duplicates issues.
- `<copy_notification_settings/>` Duplicates notification settings.
- `<copy_dashboard_settings/>` Duplicates dashboard settings.
- `<copy_invoice_layout_settings/>` Duplicates invoice layout.
settings.

<pm_approver_1/> The user_id of the project approver 1 that is substituted into the approval processes. If -6 then the approver is the 1st additional project approver.

<pm_approver_2/> The user_id of the project approver 2 that is substituted into the approval processes. If -7 then the approver is the 2nd additional project approver.

<pm_approver_3/> The user_id of the project approver 3 that is substituted into the approval processes. If -8 then the approver is the 3rd additional project approver.

<payroll_type_filter/> A payroll type filter. This holds a list of the payroll types that are allowed to book time to this project.

<shipping_contact_id/> The shipping contact ID if different than the customer designated shipping contact.

<sold_to_contact_id/> The sold to contact ID if different than the customer designated sold to contact.

<filterset_ids/> A comma separated list of filter set IDs this record should be part of.

<attachmentid/> If non-zero, the attachment record associated with this project.

<rv_approver/> The user_id of the project revenue_container approver if this is a single approver process. This field is mutually exclusive with rv_approvalprocess

If -1 then the approver is the owners manager
If -2 then the approver is the owners manager's manager
If -3 then the approver is the project owner
If -4 then the approver is self

<rv_approvalprocess/> The approvalprocess_id of the project revenue_container approval process. This field is mutually exclusive with rv_approver.

<portfolio_projectid/> The ID of the associated portfolio project.

<is_portfolio_project/> A 1/0 field - 1 if the project is a portfolio project.

<copy_revenuerecognition_auto_settings/> Duplicate of copy_revenue_recognition_auto_settings.

<filtersetids/> A comma separated list of filter set IDs this record should be part of.

<notify_issue_assigned_to/> A 1/0 field indicating whether to send email to a user whenever assigned to an issue.

<notify_issue_closed_assigned_to/> A 1/0 field indicating whether to send email to the assigned user whenever an issue is moved to a considered closed issue stage.

<notify_issue_closed_customer_owner/> A 1/0 field indicating whether to send email to the customer owner whenever an issue is moved to a considered closed issue stage.

<notify_issue_closed_project_owner/> A 1/0 field indicating whether to send email to the project owner whenever an issue is moved to a considered closed issue stage.

<notify_issue_created_customer_owner/> A 1/0 field indicating whether to send email to the customer owner whenever an issue is created.

<notify_issue_created_project_owner/> A 1/0 field indicating whether to send email to the project owner whenever an issue is created.
created
<notify_sr_submitted_project_owner/> A 1/0 field indicating whether to send email to the project owner when a schedule request is submitted for a user booked or assigned to the project.
<ta_include/> A 1/0 field indicating whether a Timesheet filterset is applied.
<te_include/> A 1/0 field indicating whether an Expense Report filterset is applied.
.rm_approver/> The user_id of the project booking approver if this is a single approver process. This field is mutually exclusive with rm_approvalprocess
If -1 then the approver is the owners manager
If -2 then the approver is the owners manager’s manager
If -3 then the approver is the project owner
If -4 then the approver is self
<rm_approvalprocess/> The approvalprocess_id of the project booking approval process. This field is mutually exclusive with rm_approver.
<rate_cardid/> The ID of the associated rate card if using rate cards.
<main_contactid/> The ID of the main project contact.
<picklist_label/> Label as shown on form picklist.
<newsfeedid/> The ID of the associated project status newsfeed.
</Project>

This datatype supports the read, add, modify, and delete XML Commands. To modify a project without recalculating it, use <Project no_recalc="1">.

Projectassign
Use the Projectassign datatype for the assignment by project feature to track users assigned to a project.

<Projectassign>
  <id/> Unique ID. Automatically assigned by the system.
  <created/> Time the record was created.
  <user_id/> The ID of the user assigned to this task.
  <project_groupid/> The ID of the project group if the user was assigned as part of a project group.
  <updated/> Time the record was last updated or modified.
  <job_codeid/> The ID of the associated job code.
  <customer_id/> The ID of the associated customer.
  <project_id/> The ID of the project to which this user is assigned.
  <allocation/> The percentage of time the associated user is allocated to this task.
</Projectassign>

This datatype supports the read, add, and modify XML Commands.

ProjectAssignmentProfile
Use the ProjectAssignmentProfile datatype to assign profiles to projects.
<ProjectAssignmentProfile>
  <id/> Unique project_assignment_profile id. Automatically assigned by
  <created/> Time the record was created
  <user_filter/> A user filter list. The project_assignment_profile only be applied to the users in this list.
  <customerid/> The ID of the associated customer
  <name/> The project_assignment_profile name.
  <updated/> Time the record was last updated or modified the system.
  <projectid/> Id of the project to which this project_assignment_profile is associated.
</ProjectAssignmentProfile>

This datatype supports the read, add, and modify XML Commands.

Projectbillingrule

Use the Projectbillingrule datatype to specify project billing rules.

<Projectbillingrule>
  <id/> Unique ID. Automatically assigned by the system.
  <created/> Time the record was created.
  <updated/> Time the record was last updated or modified.
  <name/> Name of this project billing rule.
  <user_filter/> CSV list of users to limit the rule to.
  <cap_hours/> The number of hours to cap the billing at for a time billing rule.
  <backout_gst/> If they are using GST/HST/PST taxes, back out the GST/HST taxes from re-billed expenses.
  <ticket_maximums/> Holds data on ticket maximums per expense type.
  <markup_type/> A field indicating the type of expense markup:
    P - percentage of the cost.
    S - specific amount.
  <percent/> The percentage value for a fixed fee percent trigger.
  <end_milestone/> The ID of the ending milestone (project_task).
  <daily_roll_to_next/> If the period cap is hit move the remainder to the next rule.
  <category_filter/> CSV list of categories to limit the rule to.
  <exclude_non_reimbursable/> Exclude non-reimbursable expenses.
  <percent_how/> If the fixed fee is triggered by a percent complete, this holds how it is triggered:
    A - % complete of planned hours for the project
    B - % complete of planned hours for a phase or task (the task ID is held in the start_milestone field).
  <adjust_if_capped/> If a transaction will exceed the cap, should it be adjusted to fit under the cap.
  <slip_stageid/> The ID of the slip stage to assign to the transaction.
  <markup_category/> The ID of the category a markup on expense receipts should be assigned to.
  <timetype_filter/> CSV list of timetypes to limit the rule to.
</Projectbillingrule>
The amount to cap total billing for this rule at (in the currency of the project).

Period for the cap: D - day, W - week, M - month, Q - quarter, or Y - year.

A 1/0 field indicating whether this is an active billing rule.

The rule description.

The ID of the category to assign to the transaction if it doesn't have a category.

The ID of the starting milestone (project_task).

End date of the rule.

Where we get the rate from: U - Users, R - Rate cards, or C - Category.

The type of the billing rule: T - time billing rule, E - expense billing rule, F - fixed fee billing rule, or P - purchase billing rule.

The ID of the associated agreement.

The ID of the associated customerpo.

CSV list of items to limit the rule to.

The position of the rule (0,1,2 etc.). Rules are evaluated in order and evaluation stops once a rule is satisfied.

Optional multiplier to adjust the time billing rate by.

CSV list of tasks to limit the rule to.

The ID of the associated rate card if using rate cards.

CSV list of products to limit the rule to.

Currency for the money fields in the record.

The ID of the associated repeating event.

Exclude time from archive timesheets in time billing rules.

Exclude non-billable expenses.

The amount of markup in percent or monetary amount as designated by markup_type field.

Start date of the rule.

When the category should be applied:
N - Use the selected category if the time entry does not have a category.
A - Always use the selected category.

The ID of the associated project.

If a transaction is not billed because it exceeds the cap, should the billing stop for this transaction.

The amount for a fixed fee rule.

Rules for rounding time.

Is the daily cap on a per user basis.

Accounting period date to assign to transaction.

The accounting period date of the transaction is determined by:
N - none, clear the value
E - the entity (no change)
C - container of the entity if available (i.e., timesheet, envelope)
S - submitted date of the container
A - approved date of the container
This datatype supports the read, add, and modify XML Commands.

Extra data

The `<extra_data>` field holds additional data associated with the project billing rule.

Information about Billing rule filters set to use custom fields to limit the billing rule to specific employees will be stored in the `<extra_data>` field. Review the following notes before setting Employee custom fields as billing rule filters:

- Time, Expense and Purchase billing rules support the use of Employee custom fields as billing rule filters.
- The following custom field types are supported: Checkbox, Dropdown, Dropdown and text, Pick list, and Radio buttons.
- The `<extra_data>` field stores custom field filters as a hash. The hash always needs to be formatted as follows:

```xml
$hash{'extra_data' => {'user' => {'custom_field_id_1' => 'custom_field_id_1_value_1,custom_field_id_1_value_2','custom_field_id_2' => 'custom_field_id_2_value_1,custom_field_id_2_value_2'}}};
```
The syntax for a field-value pair can be 'custom_field_id'=>'value' or 'custom_field_id','value'

For Checkbox Custom fields, use the value ‘%%OA_EMPTYSTRING%%’ for unchecked / False

Use a comma separated list of values if a custom field can have multiple values ‘value_1,value_2,value_3’

Make sure all values are correct. Any invalid value set for the custom field billing rule filter will have an adverse impact on billing transaction creation.

Always the entire hash for custom field billing rule filters even if you are only changing one value. If a field-value pair is omitted from the hash, the corresponding filter will be removed.

Projectbillingtransaction

Use the Projectbillingtransaction datatype to specify project billing transactions.

```xml
<Projectbillingtransaction>
  <id/> Unique ID. Automatically assigned by the system.
  <created/> Time the record was created.
  <updated/> Time the record was last updated or modified.
  <notes/> Notes associated with this project billing rule transaction.
  <hour/> The number of hours for a T type.
  <userid/> The ID of the associated user.
  <date/> The date of the transaction.
  <taskid/> The ID of the associated task
  <um/> The unit of measure for an E or P type.
  <rate/> The hourly rate for a T type. Dated by the date field.
  <slipid/> The ID of slip that was created.
  <ticketid/> The ID of the associated ticket.
  <project_taskid/> The ID of the associated project task.
  <project_billing_ruleid/> The ID of the associated project billing rule.
  <cost/> The cost per unit of measure for an E type. The fixed price for an F type. Dated by the date field.
  <itemid/> The ID of the associated item.
  <quantity/> The quantity for an E or P type.
  <projectid/> The ID of the associated project.
  <description/> Description associated with billing rule transaction.
  <total/> The total currency value. Dated by the date field.
  <categoryid/> The ID of the associated category.
  <minute/> The number of minutes for a T type.
  <type/> The type of the transaction. Matches the type field in project_billing_rule.
  <slip_stage_id/> The ID of the slip stage.
  <job_codeid/> The ID of the associated job code.
  <customerpoid/> The ID of the associated customerpo.
  <cost_centerid/> The ID of the associated cost center.
  <timetypeid/> The ID of the associated time type.
  <customerid/> The ID of the associated customer.
  <agreementid/> The ID of the associated agreement.
  <payroll_typeid/> The ID of the associated payroll type.
</Projectbillingtransaction>
```
ProjectBillingTransaction

The 3-letter currency code for the project billing transaction currency. Defaults to the currency field in the associated Project billing rule. Can be set to any currency specified in Administration > Global settings > Currencies > Multi-currency (if multi-currency is enabled on your account).

This datatype supports the read XML Commands.

ProjectBudgetGroup

The ProjectBudgetGroup datatype represents the complete project budget, accessible in the web application by going to Projects > Financials > Project Budget > Properties. When adding a budget, the system checks the validity of the customer and the project. When modifying an existing budget, you cannot change the project or the customer for the budget. When deleting a budget, the same rules which the web application uses apply through the API. To delete a budget, you must have edit access, and approved or archived budgets cannot be deleted.

Note: Approvals are not supported for project budgets through the API.

<ProjectBudgetGroup>
  <id/> Unique ID. Automatically assigned by the system.
  <name/> The name of the project budget group.
  <customerid/> The ID of the associated customer.
  <projectid/> The ID of the associated project.
  <date/> The date of the budget record.
  <currency/> Currency for the money fields in the record.
  <total/> The total value of the budget entry. Date set by the "date" attribute.
  <notes/> Notes associated with this project budget.
  <created/> Time the record was created.
  <updated/> Time the record was last modified.
  <total_expected_cost/> Cost total calculated from project budget transactions. Date set by the "date" attribute.
  <total_expected_billing/> Billing budget expected total. Date set by the "date" attribute.
  <total_calculated_cost/> Cost total calculated from project budget transactions. Date set by the "date" attribute.
  <total_calculated_billing/> Billing total calculated from project budget transactions. Date set by the "date" attribute.
  <total_from_funding/> A "1/0" field indicating whether to use the total from project funding documents.
  <profitability/> The profitability of this project budget group.
  <funding_total/> Total calculated from project funding documents. Date set by the "date" attribute.
  <internal_total/> Manually entered total. Date set by the "date" attribute.
  <calculated_total/> The total calculated from project budget transactions. Date set by the "date" attribute (obsolete attribute).
  <budget_by/> Sets the "Budget by" option:
    1 - budget by project
    2 - budget by phase
    3 - budget by task
  <unassigned_task/> A "1/0" field indicating whether it is possible to create budget entries not connected to any particular task.
</ProjectBudgetGroup>
<userid/> The user ID of the budget owner.

<approval_status/> The approval status of the project budget group:
0 - Open
S - Submitted
A - Approved
R - Rejected
X - Archived

<date_submitted/> The date the project budget group was submitted
<date_approved/> The date the project budget group was approved
<date_archived/> The date the project budget group was archived

<version/> Version of the project budget group.

<parentid/> The project budget group id of this budget's immediate ancestor. If zero or
null, this is a top-level project budget group.

<labor_subcategory/> Labor subcategory:
0 - category
1 - job code

<setting/> Miscellaneous settings are stored in this field as a serialized hash

<cf_pes/> Pesimistic contingency factor for this project budget.
<cf_opt/> Optimistic contingency factor for this project budget.

<externalid/> If the record was imported from an external system
you store the unique external record ID here.

<etc/> Read only calculated field.
<etc_labor/> Read only calculated field.
<etc_expense/> Read only calculated field.
<etc_purchase/> Read only calculated field.
<eac/> Read only calculated field.
<eac_labor/> Read only calculated field.
<eac_expense/> Read only calculated field.
<eac_purchase/> Read only calculated field.
<itd/> Read only calculated field.
<itd_labor/> Read only calculated field.
<itd_expense/> Read only calculated field.
<itd_purchase/> Read only calculated field.

This datatype supports the add, read, modify, and delete XML Commands.

ProjectBudgetRule

The ProjectBudgetRule datatype defines a line in the project budget grid. When adding a budget, the system checks the validity of the project budget group ID, and returns error 945 if invalid (see Error Codes). The project and customer fields are populated from the project budget group. When modifying an existing project budget rule, you cannot change the project, customer, or budget group id fields. If you change any of the following fields in a project budget rule, these fields are copied to all related project budget transactions:

- project_taskid
- category
- categoryid
- job_codeid
- itemid
- productid
Note: Approvals are not supported for project budgets through the API.

You cannot delete a rule if you don't have rights to delete the project budget.

```
<ProjectBudgetRule>
  <id/> Unique ID. Automatically assigned by the system.
  <project_budget_groupid/> The ID of the associated project_budget_group.
  <customerid/> The ID of the associated customer.
  <projectid/> The ID of the associated project.
  <project_taskid/> The ID of the associated project task.
  <category/> The main category for this budget line:
    1 - labor
    2 - expense item
    3 - purchase order
  <categoryid/> The ID of the associated category.
  <job_codeid/> The ID of the associated job code.
  <itemid/> The ID of the associated item.
  <productid/> The ID of the associated product.
  <period/> The period of the total:
    D - daily
    W - weekly
    M - monthly
    T - total (for example, the sum entered in the web application is only for one date, and not periodically recurring)
  <total_worst/> The worst-case estimate for this project budget rule.
    Date set by the "date" attribute.
  <total_best/> The best-case estimate for this project budget rule. Date set by the "date" attribute.
  <total_most_likely/> The most likely estimate for this project budget rule.
    Date set by the "date" attribute.
  <total/> The total for this project budget rule. Date set by the "date" attribute.
  <quantity_worst/> The worst-case quantity estimate for this project budget rule.
  <quantity_best/> The best-case quantity estimate for this project budget rule.
  <quantity_most_likely/> The most likely quantity estimate for this project budget rule.
  <quantity/> The quantity for this project budget rule.
  <rate/> The rate of this project budget rule.
  <profitability/> The profitability of this project budget rule.
  <date/> The date of the budget rule.
  <start_date/> Start date of the period.
  <end_date/> End date of the period.
  <currency/> Currency for the money fields in the record.
  <notes/> Notes associated with this project budget line.
  <created/> Time the record was created.
  <updated/> Time the record was last modified.
  <imported/> A 0/1 field which indicates whether the rule was imported from project task assignments or bookings (related only to the labor category).
</ProjectBudgetRule>
```

This datatype supports the add, read, modify, and delete XML Commands.

ProjectBudgetTransaction

The ProjectBudgetTransaction datatype defines a transaction in one project budget grid line. When adding a new project budget transaction, the system checks the validity of the project budget rule, and
returns error 946 if invalid (see Error Codes). The following fields are populated from the project budget rule:

- project_budget_groupid
- customerid
- projectid
- project_taskid
- categoryid
- job_codeid
- itemid
- productid

**Note:** Approvals are not supported for project budgets through the API.

When modifying an existing transaction, you cannot change the project_budget_ruleid or any of the fields populated by the add method. You cannot delete a transaction if you don't have rights to delete the project budget group.

```
<ProjectBudgetTransaction>
  <id/> Unique ID. Automatically assigned by the system.
  <project_budget_ruleid/> The ID of the associated project budget rule.
  <project_budget_groupid/> The ID of the associated project budget group.
  <customerid/> The ID of the associated customer.
  <projectid/> The ID of the associated project.
  <project_taskid/> The ID of the associated project task.
  <category/> The main category for this budget transaction:
    1 - labor
    2 - expense item
    3 - purchase order
  <categoryid/> The ID of the associated category.
  <job_codeid/> The ID of the associated job code.
  <itemid/> The ID of the associated item.
  <productid/> The ID of the associated product.
  <date/> The date of the project budget transaction.
  <currency/> Currency for the money fields in the record.
  <total_worst/> The worst-case estimate for this project budget transaction.
    Dated by the date field.
  <total_best/> The best-case estimate for this project budget transaction.
    Date set by the "date" attribute.
  <total_most_likely/> The most likely estimate for this project budget transaction.
    Date set by the "date" attribute.
  <total/> The total for this budget transaction. Date set by the "date" attribute.
  <quantity_worst/> The worst-case quantity estimate for this project budget transaction.
  <quantity_best/> The best-case quantity estimate for this project budget transaction.
  <quantity_most_likely/> The most likely quantity estimate for this project
    budget transaction.
  <quantity/> Quantity for this project budget transaction.
  <created/> Time the record was created.
  <updated/> Time the record was last updated or modified.
</ProjectBudgetTransaction>
```

This datatype supports the add, read, modify, and delete XML Commands.
Projectgroup

Use the Projectgroup datatype to document users who are assigned to a project task as a group.

```xml
<Projectgroup>
  <id/> Unique ID. Automatically assigned by the system.
  <assigned_users/> The users assigned to this project group. Can be a comma delimited list.
  <created/> Time the record was created.
  <updated/> Time the record was last updated or modified.
  <notes/> Notes associated with the project group.
  <name/> The name for the project group.
  <active/> A 1/0 field indicating whether this is active.
</Projectgroup>
```

This datatype supports the read, add, and modify XML Commands.

Projectlocation

Use the Projectlocation datatype to specify project location information.

```xml
<Projectlocation>
  <id/> Unique ID. Automatically assigned by the system.
  <created/> Time the record was created.
  <updated/> Time the record was last updated or modified.
  <notes/> Notes associated with the project location.
  <name/> The name for the project location.
  <active/> A 1/0 field indicating whether this is active.
</Projectlocation>
```

This datatype supports the read XML Commands.

Projectstage

Use the Projectstage datatype to specify project stage information.

```xml
<Projectstage>
  <id/> Unique ID. Automatically assigned by the system.
  <created/> Time the record was created.
  <updated/> Time the record was last updated or modified.
  <notes/> Notes associated with the project stage.
  <name/> The name of the project stage.
  <position/> The position of the stage.
  <enable_team/> A 1/0 field indicating if this should be the default stage for new projects.
  <enable_utilization/> Is the utilization enabled at this stage.
  <enable_project_assignments/> Are project level assignments enabled at this stage.
  <enable_phase_and_task/> Are phases and tasks enabled at this stage.
  <enable_analysis/> Is financial analysis enabled at this stage.
  <enable_billing/> Is the project billing tab enabled at this stage.
</Projectstage>
```
Is the recognition tab enabled at this stage.

Is project pricing enabled at this stage. Off by default.

Label as shown on form picklist.

This datatype supports the read, add, modify, and delete XML Commands.

Projecttask

Use the Projecttask datatype to specify information about the individual tasks or work packages that comprise a project.

Projecttask

Unique ID. Automatically assigned by the system.

Time the record was created.

Time the record was last updated or modified.

Notes associated with the project task.

Short description of this task.

The priority of the task (1 - 9).

This field is an estimate of the percentage of planned time which has been completed. It has no relation to the actual time spent on a task. (A 5-hour task could consume 50 hours of work but still be only 25% complete.)

If task budgeting is enabled this is the total cost of the task.

A 1/0 field indicating if any other project_tasks have us as a parent.

The sequence number of this task.

A timetype filter. This will hold a list of the timetypes that are allowed to book time to this task.

If set to 1, this is not billable. This is only applicable for project billing rules.

If the record was imported from an external system you store the unique external record ID here.

The category to assign to a timesheet entry assigned to this task. The feature has to be enabled for this assignment to work.

Is everyone able to assign time/expenses to this task.

Comma delimited list of task IDs which must complete before this task can start.

The name of the associated customer.

The task ID of our immediate ancestor. If zero or null, this is a project-level (top-level) task or phase.

The ID of the associated projecttask_type. Not for phases.

Calculated finish date.

Comma delimited list for task ID:days of lag time for predecessors. Only populated if there is a lag time.

Currency for the money fields in the record. This should be the same as the project currency.

The ID of the associated cost center.
<calculated_starts/> Calculated start date of the project task.
<estimated_hours/> If the use task estimating feature is turned on, this field will have the estimated total time the task will take to complete. If zero, no estimating has happened so the estimate is the same as the plan.
<project_name/> The name of the associated project.
<id_number/> User-defined task ID.
<closed/> A 1/0 field indicating if this is closed task. Additional time can not be booked against closed task.
<task_budget_revenue/> If task budgeting is enabled this is the total projected billing for the task.
<planned_hours/> Total number of hours the task is estimated to require. This is the total amount of time the task should take if worked on continuously by one person with no interruptions. A task with zero planned hours is also known as a milestone.
<use_project_assignment/> Flag set to 1 if they are using the project level user assignment.
<projectid/> The ID of the associated project.
<assign_user_names/> A comma separated list of user nicknames to assign this task to. (project_task_assign can also be used.)
<starts/> Optional scheduled starting date of this task. Overrides computed date Start_date.
<fnlt_date/> The finish no later than date of the task. The task must be finished by this date.
<customerid/> The ID of the associated customer.
<predecessors_type/> Comma delimited list of task ID:relationship type for predecessors. Only populated if the relationship type is not finish-to-start.
<default_category_1/> A feature, if enabled, would assign this default_category_1 to the category_1 for many transactions that have a category_1_id and project_task_id by searching the project_task and phase work breakdown structure for the first default_category_1 defined.
<default_category_2/> A feature, if enabled, would assign this default_category_2 to the category_2 for many transactions that have a category_2_id and project_task_id by searching the project_task and phase work breakdown structure for the first default_category_2 defined.
<default_category_3/> A feature, if enabled, would assign this default_category_3 to the category_3 for many transactions that have a category_3_id and project_task_id by searching the project_task and phase work breakdown structure for the first default_category_3 defined.
<default_category_4/> A feature, if enabled, would assign this default_category_4 to the category_4 for many transactions that have a category_4_id and project_task_id by searching the project_task and phase work breakdown structure for the first default_category_4 defined.
<default_category_5/> A feature, if enabled, would assign this default_category_5 to the category_5 for many transactions that have a category_5_id and project_task_id by searching the project_task and phase work breakdown structure for the first default_category_5 defined.
<manual_task_budget/> If set to 1 then the task budget is manually entered rather than calculated by the system.
This datatype supports the read, add, modify, and delete XML Commands. To modify a project without recalculating it, use `<Project no_recalc="1">`

**Note:** The `<Projecttask/>` datatype accepts an index attribute, which can be set to any of the fields in the project_task table. For example, when used with `id_number`, it allows the list of predecessors to be a list of these user-defined task numbers. The list is then translated to the real IDs, and the result is stored in the database. Refer to the following example:

```
<Add type="Projecttask">
    <Projecttask index="id_number">
        <predecessors>123, abc</predecessors>
    </Projecttask>
</Add>
```

The records that have their `id_number` fields set to “123” and “abc” respectively are found, and their actual “id” values are stored in the database as the “predecessors” of the current record.

**Using the limit attribute with Projecttask**

When reading project tasks, the limit attribute is applied to **projects** and not project tasks if all of the following four conditions are met:

- method="all"
- no filters are used in the request
- deleted records are not requested
- the client_type is “RW Project”

For example, if you set the limit attribute to “0,1000” as in the example below, it will find all tasks for the first 1,000 projects, and may return more than 1,000 tasks. In other words, the limit attribute limits the number of projects returned, and does not limit the number of project tasks returned.

```
<Read type="Projecttask" method="all" limit="0,1000"/>
```

In all other cases, the limit attribute is applied to **project tasks**. For example, if the method is set to “equal to” or “not equal to”, or if a filter is used in the request, the limit attribute applies to project tasks. The example below would apply the limit attribute to project tasks, and not projects:

```
<Read type="Projecttask" method="equal to" limit="0,1000"/>
```

**ProjecttaskEstimate**

This datatype holds the user estimates for time remaining against project tasks. This is used to drive percent complete calculations against the project. Required fields for this object are hours, user_id, and project_task_id. When adding or modifying a ProjecttaskEstimate object:

- A user must be assigned to the task
- That user’s user_id must exist in the system
- The timesheet_id must exist in the system
There must be a time entry for the project_task_id if sent with timesheet_id
The same estimate must not already exist

**Note:** You cannot modify an approved or archived timesheet's ProjecttaskEstimate unless you have the Allow Editing of Approved and Archived Timesheets through API feature enabled. In addition, the project task recalculation for hours remaining depends on the “Disable job recalculating from API” setting.

```xml
<ProjecttaskEstimate>
    <id/> Unique ID. Automatically assigned by the system.
    <project_task_id/> The ID of the associated project_task.
    <user_id/> The ID of the user who is assigned to the task.
    <timesheet_id/> The ID of the associated timesheet if this was updated from the timesheet.
    <hours/> The number of hours estimated to be remaining.
    <date_changed/> The date and time the estimate was last changed.
    <changed_by/> ID of the user who changed the estimate. If this does not have an ID, then the estimate was automatically generated by the system.
    <created/> Time the record was created.
    <updated/> Time the record was last updated or modified.
</ProjecttaskEstimate>
```

This datatype supports the read, add, modify, and delete **XML Commands**.

### Projecttask_type

Use the Projecttask_type datatype to specify information about a project task type.

```xml
<Projecttask_type>
    <id/> Unique ID. Automatically assigned by the system.
    <created/> Time the record was created.
    <notes/> Notes associated with the project task type.
    <active/> A 1/0 field specifying if the type is active.
    <name/> The name of the project task type.
    <updated/> Time the record was last updated or modified.
    <suppress_notification/> Suppress task notifications for this project task type.
    <picklist_label/> Label as shown on form picklist.
</Projecttask_type>
```

This datatype supports the read, add, and modify **XML Commands**.

### Projecttaskassign

Use the Projecttaskassign datatype to specify the list of users assigned to each task.

```xml
<Projecttaskassign>
    <id/> Unique ID. Automatically assigned by the system.
    <created/> Time the record was created.
    <userid/> The ID of the user assigned to this task.
    <planned_hours/> The hours for this user if the planned hours at
the user level feature is enabled.

- `<updated/>` Time the record was last updated or modified.
- `<projecttaskid/>` ID of the project task to which this user is assigned.
- `<externalid/>` If the record was imported from an external system you store the unique external record ID here.
- `<project_groupid/>` The ID of the project group if the user was assigned as part of a project group.
- `<allocation/>` The percentage of time the associated user is allocated to this task.
- `<job_codeid/>` The ID of the associated job code.
- `<project_assignment_profile_id/>` The id of the associated project assignment profile.
- `<pending_booking_id/>` The id of the associated pending booking.
- `<booking_id/>` The id of the associated booking.
- `<rule_rate_override/>` Hourly billing rate for the user assigned to the task. This is effective only if the internal switch “Enable billing rule rate override on task assignments” is enabled on your account. Negative values are not allowed.
- `<rule_rate_override_currency/>` The 3-letter currency code for the billing rate currency. Defaults to the company’s base currency if not set. Can be set to any currency specified in Administration > Global settings > Currencies > Multi-currency (if multi-currency is enabled on your account).

This datatype supports the read, add, modify, and delete XML Commands. To modify a project without recalculating it, use `<Project no_recalc="1">`.

**Note:** The `<Projecttaskassign/>` datatype is used in conjunction with `<Projecttask/>` to assign users to project tasks. Refer to the following example:

```xml
<Add>
  <Projecttaskassign>
    <userid>3</userid>
    <projecttaskid>13</projecttaskid>
    <allocation>75</allocation>
  </Projecttaskassign>
</Add>
```

**Note:** The `<Projecttaskassign/>` datatype accepts an index attribute, which works the same way as in Projecttask. We can use an alternate index to associate Projecttask by a field other than the internal id. The index attribute can be any field in Projecttask that is unique in combination with project_id. However, only the id_number is guaranteed to be unique, so the index attribute should not be used with other fields. Refer to the following example:

```xml
<Add>
  <Projecttaskassign index="id_number">
    <userid>3</userid>
    <allocation>75</allocation>
    <projectid>15</projectid>
    <projecttaskid>AQ99</projecttaskid>
  </Projecttaskassign>
</Add>
```
Note: Assuming that in these examples there is a Projecttask with an ID of 13, with an id_number of AQ99 and a projectid of 15, these two examples are identical.

You can add as many user/allocations to a Projecttask as you like.

Proposal

Use the Proposal datatype to specify proposal information.

```xml
<Proposal>
  <id/> Unique ID. Automatically assigned by the system.
  <created/> Time the record was created.
  <updated/> Time the record was last updated or modified.
  <number/> The proposal number.
  <userid/> The ID of the associated user.
  <status/> The status of the proposal: D - Draft, M - Submitted, P - Approved, Q - Rejected, S - Sent, V - Viewed, A - Accepted, or R - Refused.
  <attachments/> If non-zero, the attachment record associated with this proposal. attachment_id
  <responded/> The date and time the client accepted or refused.
  <sent/> The date and time the proposal was delivered to the client.
  <access_log/> The mailing and access history of the proposal.
  <response/> Client response notes.
  <name/> The name of this proposal.
  <submitted/> The date and time the proposal was submitted for approval.
  <approved_by/> The ID of the user who approved this proposal.
  <projectid/> The ID of the associated project.
  <description/> The description of this proposal.
  <total/> The total amount. Dated by the currency_date field.
  <approved/> The date and time the proposal was approved.
  <viewed/> The date and time the client first viewed the proposal.
  <notes/> Notes associated with this proposal.
  <customerid/> The ID of the associated customer.
  <created_by/> The ID of the user who created this proposal.
  <expires/> The date the proposal is valid until.
</Proposal>
```

This datatype supports the read XML Commands.

Proposalblock

Use the Proposalblock datatype to specify proposal blocks, the blocks of text that a proposal is composed of. A block can be free form text or it can be associated with a template. If associated with a template, it is updated when the template is updated.

```xml
<Proposalblock>
  <id/> Unique ID. Automatically assigned by the system.
  <created/> Time the record was created.
  <updated/> Time the record was last updated or modified.
</Proposalblock>
```
Proposalblock

The number of hours for a T block.

The ID of the associated template.
The content of the template.
The unit of measure for an E block or the rate description for an O block.
The hourly rate for a T block. Dated by the currency_date field.
The ID of the associated proposal.
The ID of the associated slip if this block was billed to TB.
The sequence number of the block.
The cost per unit of measure (in the currency of the proposal) for an E block, the billing rate for an O block, or the fixed price for a F block. Dated by the currency_date field.
The ID of the associated item.
The name of the this proposal block.
The quantity for an E block or an O block.
The total value of the block. Dated by the currency_date field.
The description of this proposal.
The ID of the associated category.
The number of minutes for a T block.
The type of the block: X - text only block, T - hourly rate block, E - expense block, F - flat price block, O - other type block, or P - product block.

This datatype supports the read XML Commands.

Proxy

The Proxy datatype holds data about user proxies.

The unique ID. Automatically assigned by the system.
ID of the user who is doing the proxying.
The user ID for whom you are proxying.
A "1/0" field indicating if the proxy was created by proxy_id using 'create own proxy' feature.
Role to use while proxying for this user.
The date the proxy expires.
The time the record was created.
The time the record was last updated or modified.

This datatype supports the read, add, modify, and delete XML Commands.

Purchase_item

Use the Purchase_item datatype to specify purchase item information, a single entry in a purchase order.

The unique ID. Automatically assigned by the system.
<created/> Time the record was created.
<updated/> Time the record was last updated or modified.
<date/> The date of the purchase_item. The same as the purchaseorder date.
<um/> The unit of measure for the product, i.e., EA.
<purchaserid/> The ID of the purchaser or purchasing agent. This is always the same as the purchaseorder creator (purchaser_id).
<attachmentid/> If non-zero, the attachment record associated with this purchase_item.
<approved_cost/> A snap-shot of the approved cost from the request_item (in the currency of the purchase order). 3 decimal places for handling amounts like mileage at 32.5 cents. Dated by the date field.
<manufacturer_part/> The manufacturer's part number, SKU or other unique identification for this product.
<cost/> The cost per unit of measure at which the product is ordered (in the currency of the purchase order). 3 decimal places for handling amounts like mileage at 32.5 cents. Dated by the date field.
<tax_location_name/> The name of the tax location.
<non_po/> A 1/0 field indicating that this purchase item was created without a purchase order.
<name/> The purchase name.
<total/> The total value of the purchase (in the currency of the purchase order). Dated by the date field.
<quantity_payable/> The quantity that is payable.
<customerid/> The ID of the associated customer.
<request_itemid/> The ID of the associated request_item
<vendor_quote_number/> The vendor’s quote number.
.userid/> The ID of the requester.
<purchaserequestid/> The ID of the associated purchaserequest.
<manufacturerid/> The ID of the associated manufacturer.
<currency/> Currency for the money fields in the record.
<quantity_fulfilled/> The quantity that has been fulfilled.
<date_fulfilled/> The date on which all of the quantity was fulfilled.
<purchaseorderid/> The ID of the associated purchaseorder.
<allow_vendor_substitution/> A 1/0 field indicating whether the vendor may be substituted.
<order_reference_number/> Unique reference number within purchase order.
<total_with_tax/> The total value of the purchase (in the currency of the purchase order) including tax. Dated by the date field.
<quantity/> The quantity of product_id for this purchase.
<projectid/> The ID of the associated project.
<project_taskid/> The ID of the associated project task.
<vendor_sku/> The vendor's sku for this product.
<vendorid/> The ID of the associated vendor
<notes/> Notes associated with this purchase order block.
<productid/> The ID of the associated product.
<acct_date> The accounting period date of the purchase item.
</Purchase_item>

This datatype supports the read, add, modify, and delete XML Commands.
**Note:** There are several limitations regarding purchase items: Only short-order purchase items can be added to OpenAir and only project/customer combinations can be updated on a non short-order purchase item (switch enabled). See details as follows:

- For the capability to add short-order purchase items to OpenAir, go to Administration > Application Settings > Purchases Settings and select Other settings. Scroll down and select the check box to Enable the ability to create non-PO purchase items. These are purchase items for purchases made without an OpenAir PO.
- For the capability to modify non short-order purchase items, submit a support ticket and request that the following switch be enabled: API can modify purchase items’ project association even when associated with a PO. Associated request items will also be updated. See Troubleshooting for instructions on how to create a support ticket.

**Purchaseorder**

Use the Purchaseorder datatype to specify information about a purchase order.

```
<Purchaseorder>
   <id/> Unique ID. Automatically assigned by the system.
   <created/> Time the record was created.
   <updated/> Time the record was last updated or modified.
   <receivingid/> The receiving location for this purchase order.
   <carrierid/> The carrier to be used for shipping. Ship Via.
   <date/> The date of the purchase order.
   <date_required/> The date the purchase items on this purchase order are required.
   <attachmentid/> If non-zero, the attachment record associated with this purchase order.
   <date_shipped/> The date the materials were shipped if known.
   <date_expected/> The date the materials are expected if known.
   <date_submitted/> The date the purchase order was submitted.
   <name/> The name of the purchase order (Prefix + number).
   <total/> The purchase order total cost. Dated by the date field.
   <description/> The description or purpose for the purchase order.
   <locationid/> The F.O.B. location_id (DEPRECATED).
   <shipping_cost/> The cost of shipping, if known. Dated by the date field.
   <shipping_termsid/> The id of the associated shipping payment terms, indicating how the shipping costs will be charged.
   <accounts_payableid/> The accounts payable location for this purchase order.
   <number/> The purchase order number that increments by 1.
   <userid/> The id of the user creating the purchase order. The purchasing agent.
   <terms/> Payment terms for this purchase order.
   <total_purchase_items/> The total number of purchase items in the purchase order.
   <currency/> The currency this purchase order is in.
   <quantity_fulfilled/> The quantity fulfilled on all the purchase items in this purchase order.
   <date_approved/> The date the purchase order was approved.
   <date_order_placed/> The date the purchase order was placed with
```

XML API Reference Guide
<Purchaseorder>

- `<date_fulfilled/>` The date on which all of the total quantity was fulfilled.
- `<auto_track_payable_with_fulfilled/>` A 1/0 field indicating that payability of quantities of items on this purchase order track automatically and directly with the fulfillment of those items.
- `<total_quantity/>` The total quantity of all the purchase items in this purchase order.
- `<purchase_items_fulfilled/>` The total number of fulfilled purchase items in the purchase order.
- `<approval_status/>` The approval status of the purchase request: O - open, P - pending approval, A - approved, or R - rejected.
- `<vendorid/>` The id of the associated vendor that the purchase order is for.
- `<notes/>` Notes to print on the purchase order.
- `<ship_complete_only/>` A 1/0 field indicating that full order must ship together.
- `<prefix/>` A static alphanumeric purchase order number prefix.

</Purchaseorder>

This datatype supports the read, add, modify, and delete XML Commands.

### Purchaser

Use the `<Purchaser>` datatype to specify information about a user who creates purchase orders.

- `<id/>` Unique ID. Automatically assigned by the system.
- `<created/>` Time the record was created.
- `<receivingid/>` The default receiving location for this purchaser.
- `<userid/>` The ID of the associated user.
- `<name/>` The name of the purchaser.
- `<updated/>` Time the record was last updated or modified.
- `<carrierid/>` The default carrier to be used for shipping. Ship Via.
- `<notes/>` Notes associated with the purchaser.
- `<exported/>` Date and time the record was marked as exported.
- `<accounts_payableid/>` The default accounts payable location for this purchaser.
- `<ship_complete_only/>` The default for the 1/0 field indicating that full order must ship together.
- `<active/>` A 1/0 field indicating where this is designated as an active receiving location 1/0.

</Purchaser>

This datatype supports the read XML Commands.

### Purchaserequest

Use the Purchaserequest datatype to specify purchase request information.
<Purchaserequest>
  <id/> Unique ID. Automatically assigned by the system.
  <created/> Time the record was created.
  <updated/> Time the record was last updated or modified.
  <number/> The purchase request number that increments by 1.
  <date/> The date of the purchase request.
  <userid/> The ID of the associated user creating the purchase request. The requester.
  <request_items_fulfilled/> The total number of fulfilled request items in the purchase request.
  <total_request_items/> The total number of request items in the purchase request.
  <ordered_request_items/> The total number of request items on the purchase request which are part of a purchase order.
  <date_required/> The date the material on this purchase request is required.
  <attachmentid/> If non-zero, the attachment record associated with this purchase request.
  <currency/> The currency of the total field.
  <quantity_fulfilled/> The quantity fulfilled on all the request items in this purchase request.
  <date_approved/> The date the purchaserequest was approved.
  <date_fulfilled/> The date on which all of the total quantity was fulfilled.
  <total_quantity/> The total quantity of all the request items in this purchase request.
  <date_submitted/> The date the purchaserequest was submitted.
  <approval_status/> The approval status of the purchase request: O - open, P - pending approval, A - approved, or R - rejected.
  <name/> The name of the purchaserequest (Prefix + number).
  <projectid/> The ID of the associated project that the material on this purchase request is for.
  <description/> The description or purpose for the purchaserequest.
  <total/> The purchase request total cost. Dated by date field.
  <notes/> Notes associated with the purchase request.
  <customerid/> The ID of the associated customer that the material on this purchase request is for.
  <exported/> Date and time the record was marked as exported.
  <prefix/> A static alphanumeric purchase request number prefix.
</Purchaserequest>

This datatype supports the read XML Commands.

Ratecard

Use the Ratecard datatype to map job codes to hourly rates.

<Ratecard>
  <id/> Unique ID. Automatically assigned by the system.
  <created/> Time the record was created.
  <notes/> Notes associated with the rate card.
  <active/> A 1/0 field indicating whether this is an active rate.
This datatype supports the read, add, and modify XML Commands.

**RateCardItem**

Use the RateCardItem datatype to specify rate card item information.

```xml
<RateCardItem>
  <id/> Unique ID. Automatically assigned by the system.
  <created/> Time the record was created.
  <rate_card_id/> The ID of the rate card that it is associated with.
  <job_code_id/> The ID of the associated job code.
  <currency/> Currency for the money fields in the record.
  <updated/> Time the record was last updated or modified.
  <rate/> The hourly billing rate.
  <start/> Start date of the rate for historical records.
  <end/> End date of the rate for historical records.
  <current/> A 1/0 field indicating if the record is the current rate.
</RateCardItem>
```

This datatype supports the read, add, and modify XML Commands.

**Reimbursement**

Use the Reimbursement datatype to specify reimbursement information.

```xml
<Reimbursement>
  <id/> Unique ID. Automatically assigned by the system.
  <created/> Time the record was created.
  <envelopeid/> The associated envelope the reimbursement is applied to.
  <date/> The date of the reimbursement.
  <total/> The reimbursement total. Dated by the date field.
  <updated/> Time the record was last updated or modified.
  <currency/> Currency for the money fields in the record.
  <envelope_number/> The number of the associated envelope the reimbursement is applied to.
  <externalid/> If the record was imported from an external system, you store the unique external record ID here.
  <notes/> Notes associated with the reimbursement.
  <userid/> The user associated with the envelope the reimbursement is applied to.
  <audit/> Audit trail changes.
</Reimbursement>
```
This datatype supports the read, add, modify, and delete **XML Commands**.

**Repeat**

Use the Repeat datatype to specify repeating event information.

```xml
<Repeat>
  <id/> Unique ID. Automatically assigned by the system.
  <frequency/> The repeating interval of the event: D - daily, W - weekly, M - monthly, Y - yearly.
  <every/> The spacing between each repeating event.
  <end/> End date of the event.
  <occurrence_number/> Number of occurrences.
  <how_end/> How does this event end: D - date or O - occurrence
  <exclude_dow/> When frequency is in days, which days of the week (e.g. Mon, Tue, etc) to exclude. This is a comma delimited list with 0 being Mon.
  <created/> Time the record was created.
  <updated/> Time the record was last updated or modified.
</Repeat>
```

This datatype supports the read, add, and modify **XML Commands**.

**Report**

Use the Report datatype to hold saved report definitions and settings.

```xml
<Report>
  <id/> Unique ID. Automatically assigned by the system.
  <created/> Time the record was created.
  <updated/> Time the record was last updated or modified.
  <userid/> The ID of the user who created the report. This is 0 for standard reports.
  <name/> The name of the report.
  <type/> The type of report: S = saved reports and T = standard reports.
  <thin_client_context/> A 1/0 field indicating that this report can be requested via thin clients.
  <date_created/> The date and time the report was created. This may or may not be the same as the created column. For example, reports created before 2010-01-11 and reports copied from other accounts will have different values.
  <email_report/> A 1/0 field. 1 = report executes and sends an email with a pdf attachment to the session user.
</Report>
```

This datatype supports the read **XML Commands**.
Request_item

Use the Request_item datatype to specify a request item, a single entry in a purchase request.

```xml
<Request_item>
  <id/> Unique ID. Automatically assigned by the system.
  <created/> Time the record was created.
  <updated/> Time the record was last updated or modified.
  <vendor_quote_number/> The vendor's quote number.
  <userid/> The ID of the requester. This is always the same as the purchaserrequest requester (user_id).
  <date/> The date of the request_item. The same as the purchaserrequest date.
  <manufacturerid/> The ID of the associated manufacturer.
  <purchaserequestid/> The ID of the associated purchaserrequest.
  <um/> The unit of measure for the product, i.e., EA
  <request_reference_number/> Unique reference number within purchase request.
  <attachmentid/> If non-zero, the attachment record associated with this request_item.
  <currency/> The currency used for this request item.
  <quantity_fulfilled/> The quantity that has been fulfilled.
  <productid/> The ID of the associated product.
  <date_fulfilled/> The date on which all of the quantity was fulfilled.
  <purchase_itemid/> The ID of the associated purchase_item.
  <allow_vendor_substitution/> A 1/0 field indicating whether the vendor may be substituted.
  <manufacturer_part/> The manufacturer's part number, SKU or other unique identification for this product.
  <purchaseorderid/> The ID of the associated purchase order.
  <cost/> The cost per unit of measure at which the product is being requested. 3 decimal places for handling amounts like mileage at 32.5 cents. Dated by the date field.
  <name/> The request item name.
  <quantity/> The quantity of product_id for this request item.
  <projectid/> The ID of the associated project. This is always the same as the purchase request project_id.
  <total/> The total value of the request item. Dated by the date field.
  <vendorid/> The ID of the associated vendor.
  <vendor_sku/> The vendor's sku for this product.
  <notes/> Notes associated with this request item.
  <customerid/> The ID of the associated customer. This is always the same as the purchase request customer_id.
  <exported/> Date and time the record was marked as exported.
</Request_item>
```

This datatype supports the read and delete XML Commands.

ResourceAttachment

Use the ResourceAttachment datatype to specify a user's CV attachment in their Consolidated Resource Profile.
Note: Uploading a CV using the ResourceAttachment datatype is a two-step process. For an example of this process, please see Example 5 for the Add command.

This datatype supports the add, read, modify, and delete XML Commands.

Resourceprofile

Use the Resourceprofile datatype to specify items that make up a resource profile.

This datatype supports the read, add, modify, and delete XML Commands.

Resourceprofile_type

Use the Resourceprofile_type datatype to specify information about a resource profile type.

This datatype supports the read, add, modify, and delete XML Commands.
Resourceprofile_type

The resourceprofile type. The entity on which this resourceprofile is based: Skill, Education, Location, Jobrole, Industry, or Customprofile_1..20.

<attribute_set_id/> The ID of the associated attribute set.

This datatype supports the read, add, modify and delete XML Commands.

ResourceRequest

Use the ResourceRequest datatype to specify information about a resource request type.

<ResourceRequest>
  <id/> Unique ID. Automatically assigned by the system.
  <number/> The resource request tracking number.
  <status/> The status of the resource request:
    'O' - Open
    'P' - Partial
    'S' - Complete
    'C' - Cancelled
  <percent_fulfilled/> Percent fulfilled for the resource request.
  <date_finalized/> The date the resource request was finalized and marked ready for booking.
  <date_start/> The starting date of the resource request.
  <ownerid/> The ID of the associated user creating the resource request.
  <date_end/> The ending date of the resource request.
  <booking_type_id/> The booking type of bookings created for this resource request.
  <name/> The name of the resource request.
  <projectid/> The ID of the associated project.
  <date_start_expected/> The expected starting date of the resource request.
  <external_id/> If the record was imported from an external system you store the unique external record ID here.
  <notes/> Notes field
  <customerid/> The ID of the associated customer.
</ResourceRequest>

This datatype supports the read, add, modify and delete XML Commands.

ResourceRequestQueue

Use the ResourceRequestQueue datatype to specify information about a resource request queue type.

<ResourceRequestQueue>
  <date_end/> The ending date of the resource request queue.
  <status/> The status of the resource request queue:
    'O' - Open
    'P' - Partial
    'S' - Complete
    'C' - Cancelled
  <name/> The name of the resource request queue.
</ResourceRequestQueue>
<projectid/> The id of the associated project.

ресурс_запрос_ид/> The id of the associated resource request.

<ресурс_поиск_ид/> The id of the associated base resource search.

Note: If you don't specify a resourcesearch_id the API will automatically create an empty oaResourcesearch and populate the id here.

<external_id/> If the record was imported from an external system you store the unique external record id here.

<date_start/> The starting date of the resource request queue.

<percent_fulfilled/> Percent fulfilled for the resource request queue.

<notes/> Notes field.

<customerid/> The id of the associated customer.

<slots/> The number of slots available in this queue.
</ResourceRequestQueue>

This datatype supports the read, add, modify and delete XML Commands.

Resourcessearch

Use the Resourcessearch datatype to specify information about a resource search type. See also Resource Search Virtual Fields

<Resourcesearch>

<id/> Unique ID. Automatically assigned by the system.

<include_inactive_resources/> A "1/0" field. Include inactive resources in search?

<startdate/> The start date for availability

<include_regular_resources/> A "1/0" field. Include regular resources in search?

<required/> See Resource Search Virtual Fields.

<enddate/> The end date for availability.

<updated/> Time the record was last updated or modified.

<as_percentage/> A "1/0" field indicating which of the fields... hours or percentage is to be used in the search:
If 1 then use percentage.
If 0 then use hours.

<hours/> The number of hours of availability required over this range.

<excluding/> See Resource Search Virtual Fields.

<consecutive_availability/> A "1/0" field indicating no intervening bookings.

<availability_search/> A "1/0" field indicating whether to search by availability.

<name/> The resourcesearch name.

<preferred/> See Resource Search Virtual Fields.

<percentage/> The percentage of time booked to this project during this date range.
This is either the actual booked percentage or derived from the hours.

<resource_request_queue_id/> The id of the associated resource request queue
</Resourcesearch>
This datatype supports the read, add, modify and delete XML Commands.

### Resource Search Virtual Fields

ResourceSearch uses three virtual fields: required, excluding, and preferred. These fields are processed during read and write operations for Resource Demand Request (RDR) searches.

The fields use comma separated `resourceprofile_type.id : attribute.id` pairs to specify resources.

For example, if you had the following data setup:

- `resourceprofile_type.id = 10` for “Linux skill” and `12` for “Master’s degree”.
- `attribute.id = 1` for “Beginner”, `2` for “Intermediate”, and `3` for “Expert”.

**Note:** `attribute.id = 0` means "Any"

If Attribute set is not defined for appropriate resource_profile then set `attribute.id = 0`.

With the data described above set, the following XML:

```xml
<preferred>10:1,10:2,12:0</preferred>
```

would search for resources with beginner Linux skill, intermediate Linux skill, and a Master’s degree.

### RevenueContainer

Use the RevenueContainer datatype to specify information about the revenue_container header table.

```xml
<RevenueContainer>
  <id/> Unique ID. Automatically assigned by the system.
  <number/> The revenue_container number that increments by 1.
  <date/> The date of the revenue_container.
  <balancing_type/> A one-character key indicating the type of balancing for this revenue_container. Note that all revenue_containers for a project have the same balancing_type: A - Agreement, C - CustomerPO, P - Project, X - Agreement and CustomerPO.
  <total_recognized/> The revenue_container recognized total. Dated by the date field.
  <currency/> The currency of this revenue_container.
  <date_approved/> The date the invoice was approved.
  <updated/> Time the record was last updated or modified.
  <date_submitted/> The date the invoice was submitted.
  <approval_status/> The approval status of the invoice. Used only if invoice approvals are used: O - Open, S - Submitted, A - Approved, or R - Rejected
  <total_deferred/> The revenue_container deferred total. Dated by the date field.
  <name/> The name of the revenue_container (Prefix + number).
  <acct_date/> The accounting period date of the
```
This datatype supports the read XML Commands.

RevenueProjection

Use the RevenueProjection datatype to access the slips created from a projected revenue run.
<city/> The slip city or location.
<payment_type_id/> The ID of the associated payment type.
<total_with_tax/> A 1/0 field indicating whether the cost includes the tax.
<item_id/> The ID of the associated item. If this is set, the slip is based on this item. Use the associated item type to determine the subtype of this slip.
<timetype_id/> The ID of the associated time type.
<quantity/> The quantity for an E, O, or P slip.
<project_id/> The ID of the associated project.
<project_task_id/> The ID of the task within the associated project.
<product_id/> The ID of the associated product.
<notes/> Notes associated with the slip.
<cost_center_id/> The ID of the associated cost center.
<acct_date/> The accounting period date of the slip.
<projecttask_type_id/> The ID of the projecttask_type of the associated projecttask.
<job_code_id/> The ID of the associated job code.
<payroll_type_id/> The ID of the associated payroll type.
<ref_slip_id/> For credit/rebill, ID of the original slip id.
<portfolio_project_id/> The ID of the associated portfolio project.
<category_1_id/> The ID of the associated category_1.
<category_2_id/> The ID of the associated category_2.
<category_3_id/> The ID of the associated category_3.
<category_4_id/> The ID of the associated category_4.
<category_5_id/> The ID of the associated category_5.
<revenue_recognition_rule_id/> Id of the revenue recognition rule that created this projection.
<revenue_projection_type/> The type of the projection:
R - Revenue from an "As billed" recognition rule
F - Revenue from an "Fixed fee" recognition rule
G - Revenue from an "Percent complete" recognition rule
H - Revenue from an "Incurred vs. forecast" recognition rule
J - Revenue from a "Time project billing rule" rule
U - Time billed but not recognized
T - Time not billed
<total_hp/> A high precision version of the total field. This is used for "G" type transactions as the percent complete is calculated on a daily basis can be a small number Dated by the date field
<slip_projection_id/> Id of the slip_projection that was used for an as billed rule
<project_billing_rule_id/> Id of the project billing rule that created this projection.
<slip_projection_type/> The type of the slip_projection:
X - slip projection generated from billing rule
B - Time from potentially billable transaction which did not match any billing rule
N - Time from transaction with non-billable project-task
P - Time from transaction matching a billing rule, but is partially over cap
S - Time from transaction matching a billing rule, but is completely over cap and rule indicates to Stop if capped
RevenueProjection

C - Time from transaction matching a billing rule, but is completely over cap and no more rules match
booking_type_id/>Id of the booking type if this was generated from bookings.
revenue_stage_id/>Id of the revenue stage. This will always be 'no revenue stage' 0 for revenue projections.
transaction_id/>For internal user only.
incomplete/>Is the slip complete, e.g. can it be included in an invoice. If 1 it must be edited before it can be added to an invoice.
name/>The name of the slip. This field is never populated. It is used only to satisfy subtotalling by slip in summary reports.
slip_type_id/>This field is redundant with the type field. It provides a linkage to the slip type table allowing the slip_type table to be used in the reporting mechanism.
originating_id/>For use with split slips feature. If set, the slip.id of the originating slip for this split portion.
repeat_id/>The id of the associated repeating event.
vehicle_id/>The id of the associated vehicle.
cost_includes_tax/>A 1/0 field indicating whether the cost includes the tax.
exported/>Date and time the record was marked as exported.

This datatype supports the read XML Commands.

Note: This datatype cannot be read while projections are running. This is because the table data may be incomplete until the job completes. Error 606 will be returned if a read is attempted while projects are running.

Revenue_recognition_rule

Use the Revenue_recognition_rule datatype to specify revenue recognition rules.

id/> Unique ID. Automatically assigned by the system.
created/> Time the record was created.
updated/> Time the record was last updated or modified.
user_filter/> CSV list of users to limit the rule to.
purchase_how/> How purchases should be recognized: M - mark up/down on billed purchases or B - billed purchases.
percent_complete/> The calculated percent complete value if a type P transaction.
percent/> The percentage value for a fixed fee percent trigger.
end_milestone/> ID of the ending milestone (project_task).
recognition_type/> What we are recognizing: R - revenue, C - cost, or O - other.
marked_as_ready/> Trigger recognition when a task (id in phase) is marked as ready to recognize.
brake_by_user/> Break out the transactions by user. Currently only implemented for the incurred rules.
percent_how/> How percent complete should be calculated: A - % complete of planned hours for the project.
B - % complete of planned hours for a phase.
C - Approved hours versus planned hours for the project.
D - Approved hours versus planned hours for a phase.
E - Approved hours versus budget hours for the project.
<timetype_filter/> CSV list of timetypes to limit the rule to.
<expense_how/> How expenses should be recognized: M - mark up/down on billed expenses, B - billed expenses, or I - incurred expenses.
<active/> A 1/0 field indicating whether this is an active rule.
<name/> Name of the rule.
<categoryid/> The ID of the associated category.
<start_milestone/> ID of the starting milestone (project_task).
<end_date/> End date of the rule.
<customerid/> The ID of the associated customer.
<agreementid/> ID of the associated agreement.
<type/> The type of the rule:
A - as billed rule
P - percent of time complete rule
E - expense incurred rule
F - fixed amount rule
U - purchase item rule
I - incurred versus forecast rule
T - generated from a time project billing rule
<asb_exclude_slip_type/> CSV list of the slip types to exclude from the as billed rule.
<customerpo_id/> ID of the associated customerpo.
<percent_trigger/> If the fixed fee is triggered by a percent complete, this holds how it is triggered: A - % complete of planned hours for the project or B - % complete of planned hours for a phase or task (the task id is held in the phase field).
<item_filter/> CSV list of items to limit the rule to.
<project_task_filter/> CSV list of tasks to limit the rule to.
<product_filter/> CSV list of products to limit the rule to.
<slip_stage_filter/> CSV list of slip_stage ID to limit a type A rule to.
<repeatid/> The ID of the associated repeating event.
<currency/> Currency for the money fields in the record.
<phase/> ID of the phase if percent_how is B or D. ID of the phase/task if this is a marked_as_ready or percent_trigger rule.
<acct_code/> Optional accounting system code for integration with external accounting systems.
<start_date/> Start date of the rule.
<projectid/> The ID of the associated project.
<amount/> The amount. If we have multiple amounts, the values are held in the revenue_recognition_rule_amount table.
<extra_data/> Holds extra data fields associated with the rule.
<notes/> Notes associated with this revenue recognition rule.
<acct_date/> The accounting period date to assign to the transaction.
<acct_date_how/> The accounting period date of the transaction is determined by:
N - none, clear the value
E - the entity (no change)
C - container of the entity if available (i.e., timesheet, envelope)
Revenue_recognition_rule

M - set by the specified accounting date  
P - set by the specified accounting period

<accounting_period_id/> The ID of the associated accounting period.
<cwp_centerid/> The ID of the associated cost center.
<asb_which_slips/> Which slips should be considered for the as billed rule:
A - all slips
I - slips on invoices
P - slips on approved invoices.

<project_billing_rule_filter/> CSV list of project billing rule id’s to limit a type T rule to.
<category_1id/> The ID of the associated category_1. Mutually exclusive with project_task_id.
<category_2id/> The ID of the associated category_2. Mutually exclusive with project_task_id.
<category_3id/> The ID of the associated category_3. Mutually exclusive with project_task_id.
<category_4id/> The ID of the associated category_4. Mutually exclusive with project_task_id.
<category_5id/> The ID of the associated category_5. Mutually exclusive with project_task_id.
<assigned_user/> The user to assign to fixed fee recognition.
</Revenue_recognition_rule>

This datatype supports the read, add, and modify XML Commands.

Revenue_recognition_rule_amount

Use the Revenue_recognition_rule_amount datatype to specify multiple amounts for a recognition rule.

<Revenue_recognition_rule_amount>
  <id/> Unique ID. Automatically assigned by the system.
  <created/> Time the record was created.
  <revenue_recognition_rule_id/> The ID of the associated rule.
  <customerpo_id/> The ID of the associated customerpo.
  <recognition_type/> Recognition type: R - revenue, C - cost, or O - other.
  <updated/> Time the record was last updated or modified.
  <currency/> Currency for the money fields in the record.
  <category_id/> The ID of the associated category.
  <amount/> The amount.
  <acct_code/> Optional accounting system code for integration with external accounting systems.
  <agreement_id/> The ID of the associated agreement.
  <cost_center_id/> The ID of the associated category.
  <category_1id/> The ID of the associated category_1. Mutually exclusive with project_task_id.
  <category_2id/> The ID of the associated category_2. Mutually exclusive with project_task_id.
  <category_3id/> The ID of the associated category_3. Mutually exclusive with project_task_id.
  <category_4id/> The ID of the associated category_4. Mutually exclusive with project_task_id.
</Revenue_recognition_rule_amount>
Revenue_recognition_rule_amount

The ID of the associated category_5. Mutually exclusive with project_task_id.

Revenue_recognition_transaction

Use the Revenue_recognition_transaction datatype to specify revenue recognition transactions. This is a record of a single transaction created when revenue recognition was run for a particular project.

- id: Unique ID. Automatically assigned by the system.
- created: Time the record was created.
- percent_complete: The calculated percent complete value if it is a type P transaction.
- revenue_recognition_ruleid: The ID of the associated rule.
- userid: The ID of the associated user.
- date: The date of the transaction.
- taskid: The ID of the associated task.
- customerpo_id: The ID of the associated customerpo.
- recognition_type: Recognition type: R - revenue, C - cost, or O - other.
- updated: Time the record was last updated or modified.
- slipid: The ID of the associated slip.
- currency: Currency for the money fields in the record.
- customerid: The ID of the associated customer.
- ticketid: The ID of the associated ticket.
- project_taskid: The ID of the associated project task.
- projectid: The ID of the associated project.
- total: The amount of the transaction. Dated by the date field.
- categoryid: The ID of the associated category.
- notes: Notes associated with this revenue recognition transaction.
- acct_code: Optional accounting system code for integration with external accounting systems.
- type: The type of the transaction. Matches the type field in revenue_recognition_rule.
- agreementid: The ID of the associated agreement.
- acct_date: The accounting period date of the transaction.
- cost_center_id: The ID of the associated cost center.
- category_1id: The id of the associated category_1.
- category_2id: The id of the associated category_2.
- category_3id: The id of the associated category_3.
- category_4id: The id of the associated category_4.
- category_5id: The id of the associated category_5.
- project_billing_ruleid: The ID of the associated billing rule.
- job_codeid: The ID of the associated job code.
- rate: The hourly rate for a T type. Dated by the date field.
- decimal_hours: The number of decimal hours.
- hour: The number of hours for a T type.
- minute: The number of minutes for a T type.
- revenue_containerid: The ID of the associated revenue_container once posted.
<Revenue_recognition_transaction>
  <id/> The ID of the associated revenue stage.
  <originatingid/> The ID of the originating revenue_recognition_transaction for this revenue_recognition_transaction.
  <offsetsid/> The ID of the revenue_recognition_transaction which this revenue_recognition_transaction offsets.
  <is_from_open_stage/> A 1/0 field indicating that the revenue recognition transaction was added to the revenue container from the virtual open stage, otherwise the transaction was added through revenue container revenue_recognition_transaction generation logic. If revenue_container_id is zero, revenue_stage_id should be 0 and is_from_open_stage should be 0.
  <portfolio_projectid/> The ID of the associated portfolio project.
  <agreement_externalid/> Import-only field.
  <category_externalid/> Import-only field.
  <customer_externalid/> Import-only field.
  <project_externalid/> Import-only field.
  <projecttask_externalid/> Import-only field.
  <user_externalid/> Import-only field.
</Revenue_recognition_transaction>

This datatype supports the read, add, and modify XML Commands.

RevenueStage

Use the RevenueStage datatype to specify revenue recognition transaction stage information. Index the attributes and use them to filter revenue recognition transactions.

<Role>
  <id/> Unique ID. Automatically assigned by the system.
  <name/> The name of this role.
</Role>

This datatype supports the read XML Commands.

Role

Use the Role datatype to specify role information.
### Role

<notes/> Notes associated with this role.
<default_role/> A 1/0 field indicating whether this is the default new user role.
<admin_role/> A 1/0 field indicating whether this is the chief administrator role, with full rights.
<external_id/> If the record was imported from an external system, you store the unique external record ID here.
<updated/> Time the record was last updated or modified.

This datatype supports the read XML Commands.

### Schedulebyday

Use the Schedulebyday datatype to retrieve the day-by-day representation of users’ work schedules.

```
<Schedulebyday>
  <id/> Unique ID. Automatically assigned by the system.
  <date/> The date.
  <hours/> The number of schedule hours on this date for this user, including exceptions.
  <user_id/> The id of the associated user.
  <base_hours/> The number of base hours on this date for this user.
  <target_hours/> The number of target hours for this user on this date. Target_utilization.percentage * hours.
  <target_base_hours/> The number of target base hours for this user on this date Target_utilization.percentage * base_hours.
  <created/> Time the record was created.
  <updated/> Time the record was last updated or modified.
</Schedulebyday>
```

This datatype supports the read XML Commands.

### Scheduleexception

Use the Scheduleexception datatype to describe changes to the default work schedule for a company or user.

```
<Scheduleexception>
  <id/> Unique ID. Automatically assigned by the system.
  <created/> Time the record was created.
  <workhours/> The number of hours per day during this daterange. This overrides any workhours on each day of either the account schedule or the account/user schedule.
  <userid/> The ID of the user of this is an exception to the user’s work schedule. 0 if this is an exception to an account work schedule.
  <name/> The exception name and description, e.g. New Years Day.
  <exception_type/> The type of exception. R - Date range of the exception.
  <startdate/> The start date for the exception.
</Scheduleexception>
```
Scheduleexception

@enddate/> The end date for the exception.
@enddate/> Time the record was last updated or modified.
@enddate/> The ID of the corresponding work schedule.
@enddate/> The ID of the associated time type.
@enddate/> The ID of the schedule change item from a schedule request.
</Scheduleexception>

This datatype supports the read, add, modify, and delete XML Commands.

Schedulerequest

Use the Schedulerequest datatype to specify schedule request details.

<Schedulerequest>
  @id/> Unique ID. Automatically assigned by the system.
  @created/> Time the record was created.
  @number/> The schedule request number that increments by 1.
  @userid/> The ID of the user creating the schedule request.
  @startdate/> The start date of the schedule request.
  @date/> The date of the schedule request creation.
  @attachmentid/> If non-zero, the attachment record associated with this schedule request.
  @enddate/> The end date of the schedule request.
  @approval_status/> The approval status of the schedule request: O - open, P - pending approval, A - approved, or R - rejected.
  @updated/> Time the record was last updated or modified.
  @date_approved/> The date the schedule request was approved.
  @date_submitted/> The date the schedule request was submitted.
  @customerid/> The ID of the associated customer.
  @timetype/> The time type of this schedule request: R - regular time or P - personal time.
  @timetypeid/> The ID of the associated time type.
  @project_taskid/> The ID of the associated project task.
  @projectid/> The ID of the associated project.
  @categoryid/> The ID of the associated category.
  @notes/> Notes to print on the schedule request.
  @externalid/> If the record was imported from an external system you store the unique external record ID here.
  @description/> Description or purpose for the schedule request.
  @prefix/> A static alphanumeric schedule request number prefix.
  @name/> The name of the schedule request (Prefix + number).
</Schedulerequest>

This datatype supports the read, add, modify, and delete XML Commands.

Schedulerequest_item

Use the Schedulerequest_item datatype to specify information for multiple schedule request items.

<Schedulerequest_item>
  @id/> Unique ID. Automatically assigned by the system.
This datatype supports the read, modify, and delete XML Commands.

**Slip**

Use the Slip datatype to specify slip information. A slip is an individual timebill or an individual charge to a customer. Multiple slips are aggregated into an invoice.

```xml
<Slip>
  <id/> Unique ID. Automatically assigned by the system.
  <created/> Time the record was created.
  <updated/> Time the record was last updated or modified.
  <hour/> The number of hours for a T slip.
  <date/> The date of the billing slip.
  <unitm/> The unit of measure for an E or P slip or the rate description for an O slip.
  <rate/> The hourly rate for a T slip. Dated by the date field.
  <slip_stageid/> The ID of the associated slip stage.
  <project_billing_ruleid/> The ID of the associated project billing rule.
  <cost/> The cost per unit of measure for an E or P slip, the billing rate for an O slip, or the fixed price for a F slip. Dated by the date field.
  <tax_location_name/> The name of the tax location
  <sold_to_contactid/> The ID of the contact sold to.
  <description/> The description of the billing slip.
  <total/> The total value of the slip. Dated by the date field.
  <categoryid/> The ID of the associated category. If this is set, the slip is based on this category.
  <timer_start/> The starting time of the timer.
  <minute/> The number of minutes for a T slip.
  <customerid/> The ID of the associated customer.
  <type/> The type of the slip: T - hourly rate slip, E - expense slip, F - flat price slip, O - other time slip, M - incomplete slip, or P - product slip.
  <agreementid/> The ID of the associated agreement.
</Slip>
```
<total_tax/> The total tax paid. Dated by the date field.
<customerpoid/> The ID of the associated customerpo.
<userid/> The ID of the associated user.
<invoiceid/> The ID of the associated invoice once billed.
<currency/> Currency for the money fields in the record
<city/> The slip city or location.
<decimal_hours/> The number of decimal hours for a T slip.
<payment_typeid/> The ID of the associated payment type.
<total_with_tax/> A 1/0 field indicating whether the cost includes the tax.
<shipping_contactid/> The ID of the associated shipping contact.
<itemid/> The ID of the associated item. If this is set, the slip is based on this item. Use the associated item type to determine the subtype of this slip.
<timetypeid/> The ID of the associated time type.
<quantity/> The quantity for an E, O, or P slip.
<billing_contactid/> The ID of the associated billing contact.
<projectid/> The ID of the associated project.
<projecttaskid/> The ID of the task within the associated project.
<productid/> The ID of the associated product.
<notes/> Notes associated with the slip.
<cost_centerid/> The ID of the associated cost center.
<acct_date/> The accounting period date of the slip.
<projecttask_type_id/> The ID of the projecttask_type of the associated projecttask.
<job_code_id/> The ID of the associated job code.
<payroll_type_id/> The ID of the associated payroll type.
<ref_slipid/> For credit/rebill, ID of the original slip id.
<portfolio_projectid/> The ID of the associated portfolio project.
<originating_id/> For use with split slips feature. If set, the slip.id of the originating slip for this split portion.
<category_1id/> The ID of the associated category_1.
<category_2id/> The ID of the associated category_2.
<category_3id/> The ID of the associated category_3.
<category_4id/> The ID of the associated category_4.
<category_5id/> The ID of the associated category_5.
<gl_code/> The fixed code 123455454.
<skip_recognition/> A "1/0" field indicating if this record should be recognized. Used for split charges which were already recognized.
</Slip>

This datatype supports the read, add, and modify XML Commands.

**Note:** If not all portfolio_projectids are returned from an API request, determine whether one or both of the following OpenAir internal switches are enabled.

- API should convert charges money fields to invoice currency. Only invoiced slips are returned.
- API should filter out charges associated with charge stages marked to be excluded from invoicing.

To enable or disable them, speak with your Professional Services Consultant or create a support ticket. See Troubleshooting for instructions on creating a support ticket.
SlipProjection

Use the SlipProjection datatype to hold slips created from a projected billing run. This datatype contains many of the slip datatype fields with addition fields.

```
<SlipProjection>
  <id/> Unique ID. Automatically assigned by the system.
  <created/> Time the record was created.
  <updated/> Time the record was last updated or modified.
  <hour/> The number of hours for a T slip.
  <date/> The date of the billing slip.
  <unitm/> The unit of measure for an E or P slip or the rate description for an O slip.
  <rate/> The hourly rate for a T slip. Dated by the date field.
  <slip_stageid/> The ID of the associated slip stage.
  <project_billing_ruleid/> The ID of the associated project billing rule.
  <cost/> The cost per unit of measure for an E or P slip, the billing rate for an O slip, or the fixed price for a F slip. Dated by the date field.
  <sold_to_contactid/> The ID of the contact sold to.
  <description/> The description of the billing slip.
  <total/> The total value of the slip. Dated by the date field.
  <categoryid/> The ID of the associated category. If this is set, the slip is based on this category.
  <timer_start/> The starting time of the timer.
  <minute/> The number of minutes for a T slip.
  <customerid/> The ID of the associated customer.
  <type/> The type of the slip: T - hourly rate slip, E - expense slip, F - flat price slip, O - other time slip, M - incomplete slip, or P - product slip.
  <agreementid/> The ID of the associated agreement.
  <customerpoid/> The ID of the associated customerpo.
  <userid/> The ID of the associated user.
  <invoiceid/> The ID of the associated invoice once billed.
  <currency/> Currency for the money fields in the record
  <city/> The slip city or location.
  <decimal_hours/> The number of decimal hours for a T slip.
  <payment_typeid/> The ID of the associated payment type.
  <shipping_contactid/> The ID of the associated shipping contact.
  <itemid/> The ID of the associated item. If this is set, the slip is based on this item. Use the associated item type to determine the subtype of this slip.
  <timetypeid/> The ID of the associated time type.
  <quantity/> The quantity for an E, O, or P slip.
  <billing_contactid/> The ID of the associated billing contact.
  <projectid/> The ID of the associated project.
  <projecttaskid/> The ID of the task within the associated project.
  <productid/> The ID of the associated product.
  <notes/> Notes associated with the slip.
  <slip_projection_type/> The type of the slip projection: X - slip projection generated from billing rule.
  B - Time from potentially billable transaction which did not match any billing rule.
</SlipProjection>
```
N - Time from transaction with non-billable project-task.
P - Time from transaction matching a billing rule but is Partially over cap.
S - Time from transaction matching a billing rule but is completely over cap and rule indicates to Stop if capped.
C - Time from transaction matching a billing rule but is completely over cap and no more rules match.
<booking_typeid/> ID of the booking type if this was generated from bookings.
<transactionid/> For internal use only.
<project_task_typeid/> The ID of the project task type.
<cost_centerid/> The ID of the associated cost center.
<acct_date/> The accounting period date of the task.
<job_codeid/> The ID of the associated job code.
</SlipProjection>

This datatype supports the read XML Commands.

**Slipstage**

Use the Slipstage datatype to specify the various stages a slip can be in.

```xml
<Slipstage>
    <id/> Unique ID. Automatically assigned by the system.
    <created/> Time the record was created.
    <exclude_from_invoicing/> Exclude slips of this stage from invoicing.
    <notes/> Notes associated with this slip stage.
    <name/> The name of the stage.
    <updated/> Time the record was last updated or modified.
    <position/> The position of the stage.
    <enable_slip_tab/> Display slips of this stage in a separate tab.
</Slipstage>
```

This datatype supports the read, add, and modify XML Commands.

**TagGroup**

Use the TagGroup datatype to specify user entity tags for users, customers, or projects.

```xml
<TagGroup>
    <id/> Unique ID. Automatically assigned by the system.
    <created/> Time the record was created.
    <active/> A 1/0 field indicating whether the record is active.
    <name/> Name of the tag group.
    <entity_type/> The tag group type: U - user, C - customer, or P - project.
    <searchable/> A 1/0 field indicating whether this tag group is searchable. Used only for tag group type = U.
    <updated/> Time the record was last updated or modified.
</TagGroup>
```
This datatype supports the read XML Commands.

**TagGroupAttribute**

Use the TagGroupAttribute datatype to specify attributes associated with user entity tags for users, customers, or projects.

```xml
<TagGroupAttribute>
  <id/> Unique ID. Automatically assigned by the system.
  <created/> Time the record was created.
  <active/> A 1/0 field indicating whether the record is active.
  <updated/> Time the record was last updated or modified.
  <name/> Name of the tag group attribute.
  <tag_groupid/> The ID of the tag group this attribute is in.
</TagGroupAttribute>
```

This datatype supports the read XML Commands.

**TargetUtilization**

Use the TargetUtilization datatype to specify target utilization values for a user.

```xml
<TargetUtilization>
  <id/> Unique ID. Automatically assigned by the system.
  <created/> Time the record was created.
  <updated/> Time the record was last updated or modified.
  <user_id/> The ID of the associated user.
  <start_date/> The start date for the target utilization.
  <end_date/> The end date for the target utilization. This field is automatically determined based on the next subsequently later start date row for the user. This field can be 0000-00-00 for one row which represents the unbounded value.
  <percentage/> Target utilization for this user as a percentage. For example, 75.30.
  <dirty/> A 2/1/0 field: 0 - Clean, 1 - Dirty, and 2 - Inprogress.
</TargetUtilization>
```

This datatype supports the read, add, modify, and delete XML Commands.

**Task**

Use the Task datatype to specify task information. A task is a single time entry in a timesheet grid.

```xml
<Task>
  <id/> Unique ID. Automatically assigned by the system.
  <created/> Time the record was created.
  <updated/> Time the record was last updated or modified.
  <projecttask_typeid/> The ID of the projecttask_type of the associated project_task.
  <userid/> The ID of the associated user.
</Task>
```
This datatype supports the read, add, modify, and delete XML Commands.

Note: By default, the task's loaded_cost and project_loaded_cost use the forex future rate from the exchange rate table. To force these values to use the exchange rate for the date of the time entry and not the future exchange rate, please contact OpenAir Support and request the "API to Respect Time Entry Date for Currency Conversion in Loaded Costs" feature.

Using start time and end time with Task

You can read and modify start_time and end_time for Task.
To modify start_time and end_time:

- You need the **Enable start and end time entry on timesheets** switch to be able to change start_time and end_time. The API returns an error (error code: 1406) if you attempt to edit the start/end times and the feature is not enabled.
- The valid time format is **hh:mm:ss**. Examples: 10:30:15, 2:30, 2:30:15, 2:3, 2:2:2. The API returns an error (error code: 1404) if an invalid time format or value is passed.
- The start_time value must be before the end_time value. The API returns an error (error code: 1405) if an invalid time range is passed.
- When setting start_time and end_time, you must also specify the duration in the API call using **decimal_hours** and/or **hours** and **minutes**.

  **Note:** If you specify start_time and end_time, the duration is NOT calculated. However, the duration is validated — the API returns an error (error code: 1407) if the duration does not match the period between start_time and end_time.

  The duration can be set using **decimal_hours** and/or **hours** and **minutes**.

- To clear a start_time or end_time set it to 00:00:00.
- Setting start_time and end_time to 00:00:00 will remove hours.

**Decimal time entry (hours)**

Decimal time entry for the number of hours is supported if the feature **Use Days Instead of Hours for All Time Entries** is disabled for your account:

- **hours** accepts a decimal part and the decimal part is converted to minutes. For example, `<hours>5.5</>` is equivalent to `<hours>5</><minutes>30</>`.
- Minutes passed as the decimal part of **hours** and **minutes** are added. For example, `<hours>5.5</><minutes>6</>` is equivalent to `<hours>5</><minutes>36</>`.
- **decimal_hours** accepts a decimal part and the decimal part is converted to minutes. For example, `<decimal_hours>5.5</>` is equivalent to `<hours>5</><minutes>30</>`.
- Minutes passed as the decimal part of **decimal_hours** are ignored if **minutes** is also passed. For example, `<decimal_hours>5.5</><minutes>6</>` is equivalent to `<hours>5</><minutes>6</>`.
- If both **decimal_hours** and **hours** are passed, the integer part of **decimal_hours** is ignored and only the integer part of **hours** is used. However, the decimal parts of **decimal_hours** and **hours** are added. For example, `<decimal_hours>5.5</><hours>2.1</>` is equivalent to `<hours>2</><minutes>36</>`.
- If **decimal_hours**, **hours** and **minutes** are passed, both the decimal and integer parts of **decimal_hours** are ignored. Minutes passed as the decimal part of **hours** and **minutes** are added. For example, `<decimal_hours>5.5</><hours>2.1</><minutes>20</>` is equivalent to `<hours>2</><minutes>26</>`.
Important: minutes does not accept a decimal part.

Important: It is recommended not to use Enable start and end time entry on timesheets and Use Days Instead of Hours for All Time Entries in conjunction.

When Enable start and end time entry on timesheets is enabled and a user enters a start time and end time in OpenAir, the duration is calculated in hours and not converted to days.

When using the API and both features are enabled, passing decimal_hours and minutes but not hours in the API call will result in an error (error code 1407).

TaskTimecard

Use the TaskTimecard datatype to specify tasks associated with timecards.

```xml
<TaskTimecard>
  <id/> Unique ID. Automatically assigned by the system.
  <created/> Time the record was created.
  <updated/> Time the record was last updated or modified.
  <project_task_typeid/> The ID of the project task type.
  <project_phaseid/> The ID of the project phase.
  <userid/> The ID of the associated user.
  <date/> The date of the task timecard.
  <decimal_hours/> The number of decimal hours for the task timecard.
  <cost_centerid/> The ID of the associated cost center.
  <slipid/> The ID of the associated slip.
  <hours/> The number of hours for the task timecard.
  <timetypeid/> The ID of the associated time type.
  <minutes/> The number of minutes for the task timecard.
  <projectid/> The ID of the associated project.
  <description/> The description of the task timecard.
  <categoryid/> The ID of the associated category.
  <project_taskid/> The ID of the task within the associated project.
  <timesheetid/> The ID of the associated timesheet.
  <notes/> Notes associated with this task timecard.
  <time_cardid/> The ID of the associated time card.
  <customerid/> The ID of the associated customer.
  <payroll_typeid/> The ID of the associated payroll type.
  <category_1id/> The ID of the associated category_1.
  <category_2id/> The ID of the associated category_2.
  <category_3id/> The ID of the associated category_3.
  <category_4id/> The ID of the associated category_4.
  <category_5id/> The ID of the associated category_5.
</TaskTimecard>
```

This datatype supports the read XML Commands.

TaxLocation

Use the TaxLocation datatype to specify tax location information.
This datatype supports the read, add, and modify XML Commands.

TaxRate

Use the TaxRate datatype to specify tax rate information.

This datatype supports the read, add, and modify XML Commands.

Term

Use the Term datatype to specify term information. Terms are the customizable terminology your company uses. For example, in a doctor's office, a customer might be called a patient.
<Term>
  <name/> The name for the term.
  <display/> Display the term as.
</Term>

This datatype supports the read XML Commands.

**Note:** When you use read, you can see the original or default term as well as the term that is currently being used.

**Ticket**

Use the Ticket datatype to specify ticket information. A ticket, also known as a receipt, is an individual expense item for an expense report. An expense report can contain multiple tickets.

<Ticket>
  <id/> Unique ID. Automatically assigned by the system.
  <created/> Time the record was created.
  <updated/> Time the record was last updated or modified.
  <date/> The date of the ticket.
  <unitm/> The unit of measure.
  <reference_number/> Unique reference number within envelope. Used to cross-reference digital receipts with paper receipts.
  <currency_total_tax_paid/> The tax paid in the foreign currency if this is a foreign currency receipt.
  <tax_rateid/> The ID of the associated tax rate.
  <currency_rate/> The conversion rate if this is a foreign currency receipt.
  <total_no_tax/> The total paid before tax added. Dated by the date field.
  <project_taskid/> The ID of the associated project task.
  <cost/> The cost per unit of measure. Dated by the date field.
  <tax_location_name/> The name of the tax location.
  <non_billable/> If set to 1 this is not billable.
  <description/> The description of the ticket.
  <total/> The total value of the ticket. Dated by the date field.
  <categoryid/> The ID of the associated category.
  <customerid/> The ID of the associated customer.
  <paymethod/> Payment method now comes from payment_type table. Keep for backwards compatibility.
  <userid/> The ID of the associated user.
  <status/> The status of the ticket: R - reimbursable or N - nonreimbursable.
  <currency/> Currency for the money fields in the record.
  <city/> The ticket city or location.
  <cost_centerid/> The ID of the associated cost center.
  <slipid/> The ID of the associated slip.
  <currency_cost/> The cost per unit of measure in the foreign currency if this is a foreign currency receipt.
  <payment_typeid/> The ID into the payment type field for the payment method.
  <currency_symbol/> The currency for foreign currency receipts.
  <tax_location_id/> The ID of the associated tax location.
</Ticket>
<Ticket>
  <itemid/> The ID of the associated item.
  <envelopeid/> The ID of the associated envelope.
  <quantity/> The quantity.
  <projectid/> The ID of the associated project.
  <total_tax_paid/> The tax paid. Dated by the date field.
  <vendorid/> The ID of the associated vendor.
  <missing_receipt/> If set to 1, the paper receipt is missing for this ticket.
  <acct_date/> The accounting period date of the ticket.
  <notes/> Notes associated with the ticket.
  <attachmentid/> If non-zero, the attachment record associated with this ticket.
  <currency_exchange_intolerance/> A 1/0 field indicating if the record is within the specified foreign currency tolerance as defined in database data definitions.
  <externalid/> If the record was imported from an external system you store the unique external record ID here.
  <projecttask_typeid/> The ID of the associated project_task_type. Only if project_task_id switch is on.
  <thin_client_id/> Used by thin clients to reconcile imported records.
  <user_locationid/> The location ID for this user.
</Ticket>

This datatype supports the read, add, modify, and delete XML Commands.

Note: There is an OpenAir internal switch that prohibits you from editing the following fields created through the American Express receipt import wizard: date, quantity, cost, currency, payment_typeid, and total. However, in the event that editing is necessary, you can request that the following switch be temporarily disabled: Do not allow editing of receipts with an American Express transaction number. To enable or disable the internal switch, speak with your Professional Services Consultant or create a support ticket. See Troubleshooting for instructions on creating a support ticket.

Timecard

Use the Timecard datatype to specify timecard information.

<Timecard>
  <id/> Unique ID. Automatically assigned by the system.
  <created/> Time the record was created.
  <time_start/> Time they started working.
  <hours/> Hours worked.
  <notes/> Notes associated with the timecard.
  <updated/> Time the record was last updated or modified.
  <userid/> The ID of the associated user.
  <date/> The date of the time card.
  <break_end/> Time they ended the break.
  <break_start/> Time they started the break.
  <timesheetid/> The ID of the associated timesheet.
  <time_end/> Time they stopped working.
</Timecard>
This datatype supports the read XML Commands.

**Timesheet**

Use the Timesheet datatype to specify timesheet information.

```xml
<Timesheet>
  <id/> Unique ID. Automatically assigned by the system.
  <created/> Time the record was created.
  <updated/> Time the record was last updated or modified.
  <userid/> The ID of the associated user.
  <status/> The status of the timesheet: O - Open, S - Submitted, A - Approved, R - Rejected, or X - Archived.
  <default_payrolltypeid/> The default payroll type ID this timesheet is associated with.
  <default_timetypeid/> The default time type ID this timesheet is associated with.
  <name/> The name of the timesheet.
  <default_customerid/> The default customer ID this timesheet is associated with. All new task entries get this default value.
  <submitted/> The date the timesheet was submitted.
  <total/> The total number of hours in the timesheet.
  <default_categoryid/> The default category ID this timesheet is associated with. All new task entries get this default value.
  <ends/> The ending date of the timesheet.
  <starts/> The starting date of the timesheet.
  <approved/> The date the timesheet was approved.
  <notes/> Notes related to this timesheet.
  <default_projectid/> The default project ID this timesheet is associated with.
  <acct_date/> The accounting period date of the task.
  <thin_client_id/> Used by thin clients to reconcile imported records.
  <history/> History of events that occurred to the Timesheet.
  <approved_by/> Empty value kept for backwards compatibility.
  <duration/> The duration of the timesheet:
    W - Weekly
    D - Daily
    M - Monthly
    B - Bi-weekly
    S - Semi-monthly
  <default_projecttaskid/> The default task id this timesheet is associated with.
    All new task entries get this default value.
  <default_per_row/> Holds a data structure of per row defaults.
    The format is as follows:
    Multiple CSV rows with each row having the element name
    ("cp","category" etc.) as the first record and then the id values
    per row.
  <min_hours/> Calculated minimum number of hours required on the timesheet
    as determined by the corresponding timesheet rule. Supports the Read
</Timesheet>
```
command only. Returned only if the rule is active and the attribute calculate_hours is set to '1' in the Read request.

<max_hours/> Calculated maximum number of hours allowed on the timesheet as set in Timesheet rules. Supports the Read command only. Returned only if the rule is active and the attribute calculate_hours is set to '1' in the Read request.

</Timesheet>

This datatype supports the read, add, modify, submit, approve, reject, unapprove and delete XML Commands.

Note: Refer to the following notes regarding the Timesheet datatype:

- To be able to edit an approved or archived timesheet, the following internal switch must be enabled: API will allow editing of approved and archived Timesheets.
- If the following switches are enabled, timesheets cannot be edited:
  - Do not allow the owner to edit a submitted timesheet
  - Disable editing of exported timesheets
- The minimum number of hours required on timesheet (<min_hours>) and/or maximum number of hours allowed on timesheet (<max_hours>) may be set as fixed hours or as a percentage of the work schedule in Administration > Application settings > Timesheet Settings > Timesheet rules. These calculated fields support the Read command only. Values are returned only if the corresponding rule is active and the attribute calculate_hours is set to '1' in the Read request. Using the attribute calculate_hours may slow the response time significantly, particularly if the Timesheet rules are active and set to 'Percent of work schedule'.

A user who attempts to modify another user's timesheet must have a full Account Administrator role. Refer to Add/Modify Errors for more information on error code 821 relating to Timesheets.

If you would like to determine whether any of these internal switches are enabled, speak with your Professional Services Consultant or create a support ticket. See Troubleshooting for instructions on creating a support ticket.

Timetype

Use the Timetype datatype to specify information for time types such as regular time, overtime, sick time.

<Timetype>
  <id/> Unique ID. Automatically assigned by the system.
  <created/> Time the record was created.
  <notes/> Notes associated with this time type.
  <active/> A 1/0 field indicating whether this is time type is active.
  <name/> The name of the time type.
  <updated/> Time the record was last updated or modified.
  <externalid/> If the record was imported from an external system you store the unique external record ID here.
  <payroll_code/> The payroll code for this time type.
  <cost_centerid/> The ID of the associated cost center.
  <code/> Optional accounting system code for integration with external accounting systems.
  <picklist_label/> Label as shown on form picklist.
</Timetype>
This datatype supports the read, add, modify, and delete XML Commands.

Todo

Use the Todo datatype to specify information about something that needs to be done.

```xml
<Todo>
  <id/> Unique ID. Automatically assigned by the system.
  <created/> Time the record was created.
  <priority/> Todo priority (1 - 9).
  <contactid/> The ID of the associated contact.
  <name/> The name or description of the to do item.
  <updated/> Time the record was last updated or modified.
  <due/> Date and time the task is due.
  <userid/> The ID of the associated user.
  <dealid/> The ID of the associated deal.
  <status/> Todo status: N - Not Started, C - Completed, W - Waiting, D - Deferred, or A - Active.
  <notes/> Notes associated with the to do item.
  <customerid/> The ID of the associated customer.
  <createdbyid/> The ID of the user who created the to do item.
  <finished/> Date and time the task was finished.
  <start/> Date and time the task is to be started.
</Todo>
```

This datatype supports the read XML Commands.

Uprate

Use the Uprate datatype to specify information about user and project rate combinations.

```xml
<Uprate>
  <id/> Unique ID. Automatically assigned by the system.
  <created/> Time the record was created.
  <userid/> The ID of the associated user.
  <customerid/> The ID of the associated customer.
  <notes/> Notes associated with the user project rate (uprate).
  <updated/> Time the record was last updated or modified.
  <duration/> Billing rate: H - hourly or D - Daily.
  <projectid/> The ID of the associated project.
  <categoryid/> The ID of the associated category.
  <currency/> Currency for the money fields in the record.
  <rate/> The billing rate.
  <project_billing_ruleid/> If project billing rules are used, this is the ID of the associated project billing rule.
  <job_codeid/> The ID of the associated job code.
</Uprate>
```

This datatype supports the read, add, modify and delete XML Commands.
**Note:** Uprate is used in conjunction with the `<Company><rate_from/></Company>` setting. If `<rate_from/>` is set to up, then project billing rates will come from the individual users associated to project tasks.

**User**

Use the User datatype to specify user information.

```
<User>
    <id/> Unique ID. Automatically assigned by the system.
    <created/> Time the record was created.
    <updated/> Time the record was last updated or modified.
    <project_access_nodes/> Comma delimited list of hierarchy node IDs for project level access control.
    <addr> The user's address.
    <po_approver/> The user_id of the purchase order approver if this is a single user approver process. This field is mutually exclusive with po_approvalprocess. 1 - approver is the manager and 2 - approver is the manager's manager.
    <rate/> The hourly billing rate
    <br_approvalprocess/> The approvalprocess_id of the booking_request approval process. This field is mutually exclusive with br_approver.
    <password/> The user's password.
    <te_approver/> The user_ID of the expense report approver if this is a single approver process. This field is mutually exclusive with te_approvalprocess. 1 - approver is the manager and 2 - approver is the manager's manager.
    <sr_approver/> The user ID of the schedule request approver if this is a single approver process. This field is mutually exclusive with sr_approvalprocess. 1 - approver is the manager and 2 - approver is the manager's manager.
    <departmentid/> The ID of the associated department.
    <tb_filter_set/> The ID of the optional filter set for the Invoices module.
    <name/> The name used for display in lists. This is programmatically generated if not entered.
    <hierarchy_node_ids/> The IDs of the associated hierarchy nodes.
    <po_approvalprocess/> The approvalprocess_id of the purchase order approval process. This field is mutually exclusive with po_approver.
    <rm_filter_set/> The ID of the optional filter set for the Resources module.
    <hint/> Password hint.
    <dr_approver/> The user ID of the deal booking request approver if this is a single approver process. This field is mutually exclusive with dr_approvalprocess. 1 - approver is the manager and 2 - approver is the manager's manager.
    <br_approver/> The user ID of the booking request approver if this is a single approver process. This field is mutually exclusive with br_approvalprocess. 1 - approver is the manager and 2 - approver is the manager's manager.
    <az_approvalprocess/> The approvalprocess_id of the expense
```
authorization approval process. This field is mutually exclusive with az_approver.

<pm_filter_set/> The ID of the optional filter set for the Projects module.
<currency/> The currency for money fields.
<cost_centerid/> The ID of the associated cost center.
<locked/> A 1/0 field indicating if this user is locked.
<filterset_stamp/> A unique string which changes when the primary filter set changes for the user.
<job_codeid/> The ID of the current job code this user belongs to.
<payroll_code/> The payroll code for this user.
<report_filter_set/> The ID of the optional filter set for Reporting.
<km_filter_set/> The ID of the optional filter set for the Workspaces module.
<az_approver/> The user ID of the expense authorization approver if this is a single approver process. This field is mutually exclusive with az_approvalprocess. 1 - approver is the manager and 2 - approver is the manager's manager.
<role_id/> The ID of the associated role.
<br_approvalprocess/> The approvalprocess_id of the deal_booking_request approval process. This field is mutually exclusive with br_approver.
<te_approvalprocess/> The approvalprocess_id of the expense report approval process. This field is mutually exclusive with te_approver.
<ta_approvalprocess/> The approvalprocess_id of the timesheet approval process. This field is mutually exclusive with ta_approver.
<filterset_ids/> A comma separated list of filter set IDs this record should be part of.
<active/> A 1/0 field indicating where this is designated as an active user.
<externalid/> If the record was imported from an external system, you store the unique external record ID here.
<ta_approver/> The user ID of the timesheet approver if this is a single approver process. This field is mutually exclusive with ta_approvalprocess. 1 - approver is the manager and 2 - approver is the manager's manager.
<generic/> A 1/0 field indicating whether this is a generic resource.
<pr_approver/> The user ID of the purchase request approver if this is a single user approver process. This field is mutually exclusive with pr_approvalprocess. 1 - approver is the manager and 2 - approver is the manager's manager.
<pb_approvalprocess/> The approvalprocess_id of the proposals approval process. This field is mutually exclusive with pb_approver.
<type/> Legacy field.
<workscheduleid/> The ID of the associated user workschedule.
<po_filter_set/> The ID of the optional filter set for the Purchases module.
<primary_filter_set/> The ID of the primary filter set for this user.
<user_locationid/> The location ID for this user.
<account_workscheduleid/> The ID of the associated user account
workschedule.
<om_filter_set/> The ID of the optional filter set for the
Opportunities module.
<ssn/> The user's social security number.
<acct_code/> Optional accounting system code for integration
with external accounting systems.
<ma_filter_set/> The ID of the optional filter set for the My
Account module.
<te_filter_set/> The ID of the optional filter set for the
Expenses module.
<sr_approvalprocess/> The approvalprocess_id of the
schedule_request approval process. This field is mutually
exclusive with sr_approver.
<nickname/> The user's nickname. This must be unique.
<pb_approver/> The user ID of the booking request approver if
this is a single approver process. This field is mutually
exclusive with br_approvalprocess. 1 - approver is the manager
and 2 - approver is the manager's manager.
<logintime/> The date and time of the user's last login.
<pr_approvalprocess/> The approvalprocess_id of the purchase
request approval process. This field is mutually exclusive with
pr_approver.
<line_managerid/> The ID of this user's line manager (will
actually be another user_id).
<week_starts/> The day the week starts for this user: 0 - Monday
or 6 - Sunday.
<ta_filter_set/> The ID of the optional filter set for the
Timesheets module.
<flags/> A collection of Switch values.
<update_workschedule/> A 1/0 field indicating an update to the
user's workschedule.
<is_user_schedule/> A 1/0 field indicating whether the user
should draw their workschedule from an account_workschedule or
draw from a custom workschedule. 0 sets the user workschedule to
the account workschedule specified in account_workscheduleid, 1
constructs a custom workschedule from the supplied
workschedule_workdays and workschedule_workhours fields.
<workschedule_workdays/> A CSV list of workdays, with each value
indicating a day in the schedule and values ranging from
0(Monday) to 6(Sunday). For example, "0,1,4" indicates that a
user works on Monday, Tuesday and Friday.
<workschedule_workhours/> A CSV list of values for the user's
default workhours and workhours for each day. At least one value
for workschedule_workhours must be submitted, but a value for
each day may be submitted as well. For example, if the user's
workschedule_workdays is set to "0,1,4", then submitting a value
of only "8" for workschedule_workhours sets the user's default
hours to 8 and each workday assumes this value as well. In
addition, submitting a workschedule_workdays value of "8,1,2,3"
sets the user's default workhours to 8, sets Monday to 1, Tuesday
to 2, and Friday to 3.
<update_tag/> Set this field to 1 to enable automatic updating of
user entity tags.
<tag_start_date/> Start date for the new tag. If left blank, the start date for the new tag will be set to the current date.
<tag_end_date/> End date for the new tag. If left blank, the end date for the new tag will be undefined and the new tag will assume default status for the user.
<tag_group_id/> The ID of the tag group for the new tag.
<tag_group_attribute_id/> The ID of the tag group attribute that is being assigned to the new tag.
<update_cost/> Set this field to 1 to enable automatic updating of user loaded cost.
<cost_start_date> Start date for the new loaded cost. If blank, the new cost will assume the current date as it's start date.
<cost_end_date/> End date for the new loaded cost. If left blank, the new cost will have no end date.
<cost/> New cost value.
<cost_currency/> Currency of the cost.
<cost_lc_level/> If multiple loaded cost levels are enabled, use this field to hold the level of the loaded cost.
<timezone/> The user's timezone.
<book_assign_stamp/> Internal hash key.
<code/> The acct_code.
<external_id/> The unique external record ID if the record was imported from an external system.
<password_forced_change/> A 1/0 field indicating whether the password must change at next login.
<ta_approver_externalid/> Import-only field.
<user_location_externalid/> Import-only field.
<job_code_externalid/> Import-only field.
<role_externalid/> Import-only field.
<pm_filter_set_externalid/> Import-only field.
<tb_filter_set_externalid/> Import-only field.
<pr_approver_externalid/> Import-only field.
<po_approver_externalid/> Import-only field.
<cost_center_externalid/> Import-only field.
<rm_filter_set_externalid/> Import-only field.
<sr_approver_externalid/> Import-only field.
<te_approver_externalid/> Import-only field.
<om_filter_set_externalid/> Import-only field.
<pb_approver_externalid/> Import-only field.
<ma_filter_set_externalid/> Import-only field.
<km_filter_set_externalid/> Import-only field.
<line_manager_externalid/> Import-only field.
<report_filter_set_externalid/> Import-only field.
<dr_approver_externalid/> Import-only field.
<ta_filter_set_externalid/> Import-only field.
<account_workschedule_externalid/> Import-only field.
<po_filter_set_externalid/> Import-only field.
<te_filter_set_externalid/> Import-only field.
<br_approver_externalid/> Import-only field.
<primary_filter_set_externalid/> Import-only field.
<az_approver_externalid/> Import-only field.
<department_externalid/> Import-only field.
<rm_approver/> The user_id of the booking approver if this is a single user approver process.
This field is mutually exclusive with rm_approvalprocess.
If -1 then the approver is the manager.
If -2 then the approver is the manager's manager.

<rm_approvalprocess> The approvalprocess_id of the booking approval process. This field is mutually exclusive with rm_approver.
<picklist_label> Label as shown on form picklist.
<cv_attachment_id> The ID of the user's latest CV.

This datatype supports the read, CreateUser, modify, and delete XML Commands.

**Note:** In order to return a generic user in a read command, add a generic attribute to the read request. See *generic* in Attributes.

**Note:** When using the <Modify/> command, the <flags/> section of the <User/> record will be ignored unless the current authorized user is an administrator. To modify flags for a particular user record, submit the <flags/> portion in the <Modify type "User"> command. Refer to the following example:

```xml
<Modify type="User">
    <User>
        <id>1</id>
        <flags>
            <Flag>
                <name>flag_name</name>
                <setting>X</setting>
            </Flag>
        </flags>
    </User>
</Modify>
```

**Note:** The <Delete/> command supports the "User" datatype, so you can delete user records from an account. You cannot delete a user record from the system if there are existing transactions that are associated with it. Refer to the following example:

```xml
<Delete type="User">
    <User>
        <id>1</id>
    </User>
</Delete>
```

**Set User Workschedule**

Refer to UserWorkschedule to read user workschedule information.

**To set the user workschedule while updating or creating users:**

1. Set the update_workschedule field of the user datatype to 1.
2. To set up a user-specified work schedule, set the is_user_schedule flag to 1.
- Populate the `workschedule_workdays` field with a CSV list of user workdays. The values in the list should be numbers ranging from 0 (Monday) to 6 (Sunday). For example, 0,1,4 would mean the user works Monday, Tuesday, Friday, while populating the field with a value of just 0 would mean the user only works on Monday.
- Populate the `workschedule_workhours` field with a CSV list of hours to be worked each day. The first value corresponds to the Default value, while subsequent values correspond to the days specified in `workschedule_workdays`. Using the above example, 8,1,2,3 would set the default workhours value to 8, Monday to 1, Tuesday to 2 and Friday to 4.

**Note:** If the internal switch "Enable distinct work hours per day on workschedule" is not set, the `workschedule_workhours` field should only contain one value, the default.

3. Set the `is_user` schedule flag to 0 to use the company work schedule specified in the `account_workscheduleid` field.

### Update User Entity Tags Automatically

**To automatically update a user’s entity tags, set the following fields in the User datatype:**

1. `update_tag`: Set this field to 1 to enable automatic updating of user entity tags.
2. `tag_start_date`: Start date for the new tag. If left blank, the start date for the new tag will be set to the current date.
3. `tag_end_date`: End date for the new tag. If left blank, the end date for the new tag will be undefined and the new tag will assume default status for the user.
4. `tag_group_id`: ID of the tag group for the new tag.
5. `tag_group_attribute_id`: ID of the tag group attribute that is being assigned to the new tag.

**Refer to the following example for initial imports:**

If the user has no tags currently set and a modify is performed, the user will receive a new default tag with a start date of the current date and the supplied `tag_group_id` and `tag_group_attribute_id`.

1. Set `update_tag`=1. (This enables automatic updating of user entity tag.)
2. Set `tag_start_date`=blank. (This indicates that the start date should be the current date.)
3. Set `tag_end_date`=blank.
4. Set `tag_group_id`=ID of a valid tag group.
5. Set `tag_group_attribute_id`=ID of a valid tag group attribute.

**Refer to the following example for subsequent imports:**

On subsequent imports of user tag information, the existing tags are automatically adjusted to accommodate the new tag. The previously imported tag’s end date is set to the day before the start date of the new tag, i.e., yesterday, and the tag loses its default status. The new tag assumes default status and has a start date of the current date, i.e., today. Using the above example, assume the following fields were set during a modify on a user object.

2. Set `tag_start_date`=blank.
3. Set `tag_end_date`=blank.
After this update, the previously imported tag will have it's end date set to the day before the start date of the new tag (yesterday) and will also lose it's default status. The new tag will assume default status and will have a start date of today.

**Update User Loaded Costs Automatically**

The way you automatically update user loaded costs is similar to updating user entity tags, although there are a few key differences.

- First, default costs cannot be set using this method. All costs loaded using this method are treated as historical cost records.
- Second, only costs with the same cost lc_level are compared when determining which historical records should be altered. If no cost lc_level is specified, an lc_level of 0 is assumed.

**To automatically update user loaded costs, the following fields should be set:**

1. update_cost: Set this field to 1 to enable automatic updating of user loaded cost.
2. cost_start_date: Start date for the new loaded cost. If left blank, the new cost will assume the current date as it's start date.
3. cost_end_date: End date for the new loaded cost. If left blank, the new cost will have no end date.
4. cost: New cost value.
5. cost_currency: Currency of the cost.
6. cost_lc_level: If multiple loaded costs are enabled, use this field to hold the level of the loaded cost.

**UserLocation**

Use the UserLocation datatype to specify user location information.

```xml
<UserLocation>
  <id/> Unique ID. Automatically assigned by the system.
  <name/> The name of the user location.
  <external_id/> The unique external record ID if the record was imported from an external system.
  <acct_code/> Optional accounting system code for integration with external accounting systems.
  <notes/> Notes associated with this user location.
  <active/> A 1/0 field indicating whether the record is active.
  <created/> Time the record was created.
  <updated/> Time the record was last updated or modified.
</UserLocation>
```

This datatype supports the read, add, modify, and delete XML Commands.

**UserWorkschedule**

Use the UserWorkschedule datatype to retrieve information about user-specific and company-wide work schedules.
This datatype supports the read XML Commands.

Vendor

Use the Vendor datatype to specify vendor information.

<Vendor>
  <id/> Unique ID. Automatically assigned by the system.
  <created/> Time the record was created.
  <updated/> Time the record was last updated or modified.
  <addr/> The vendor's address.
  <terms/> Standard payment terms for the vendor.
  <purchaseorder_text/> Text to display on every purchase order.
  <currency/> Currency for the money fields in the record. Also the default currency when a purchase order is created.
  <web/> Vendor's Web address.
  <code/> Optional accounting system code for integration with external accounting systems.
  <attention/> To whom purchase orders should be sent.
  <name/> The vendor name. This shows up on all the vendor pop-up windows in the application.
  <active/> A 1/0 field indicating where this is designated as an active vendor 1/0.
  <purchaseorder_email_text/> Extra text to include in emails announcing purchase orders.
  <externalid/> If the record was imported from an external system, store the unique external record ID here.
  <tax_locationid/> The ID of the associated tax location.
  <notes/> Notes associated with this vendor.
  <picklist_label/> Label as shown on form picklist.
This datatype supports the read, add, modify, and delete XML Commands.

Viewfilter

Use the Viewfilter datatype to filter lists or calendars.

```
<Viewfilter>
  <id/> Unique ID. Automatically assigned by the system.
  <created/> Time the record was created.
  <updated/> Time the record was last updated or modified.
  <userid/> The user who created this filter.
  <name/> The internal name of the list or calendar this filter is applied to.
  <label/> The name given to this filter. It appears in the Filter: drop-down list.
  <action/> The filter action.
  <fields/> Comma delimited list of fields.
  <match_all/> A 1/0 field. 1 = if all rules met. 0 = if rules must be met.
</Viewfilter>
```

This datatype supports the read XML Commands.

Viewfilterrule

Use the Viewfilterrule datatype to specify the individual rules for a particular viewfilter.

```
<Viewfilterrule>
  <id/> Unique ID. Automatically assigned by the system.
  <created/> Time the record was created.
  <updated/> Time the record was last updated or modified.
  <viewfilterid/> The viewfilter to which this rule belongs.
  <field/> The field or column to be compared.
  <type/> The underlying type of the field or column to be compared: C = character string, N = number, D = date, B = Yes/No, P1 = picker_button, P2 = pop-up menu.
  <condition/> One of the following conditions: ct = contains, nc = does not contain, eq = is equal to, ne = is not equal to, bw = begins with, ew = ends with, gt = is greater than, ge = is greater than or equal to, lt = is less than, le = is less than or equal to, in = in the set of.
  <value/> The value the field is compared to.
  <required/> A 1/0 field. 1 = if this condition must be met. 0 = if this is one of many that will satisfy this viewfilter. (If 1, this condition is ANDed with the others. If 0, this condition is ORed with the others.)
</Viewfilterrule>
```

This datatype supports the read XML Commands.
**WorkscheduleWorkhour**

Use the WorkscheduleWorkhour datatype to read the number of hours worked per day.

```xml
<WorkscheduleWorkhour>
  <id/> Unique id. Automatically assigned by the system.
  <workscheduleid/> The ID of the associated primary account workschedule.
  <workday/> A one-letter string indicating which day of the week.
          Monday is '0', Tuesday is '1', ..., Sunday is '6'
  <workhours/> The number of hours worked for this day.
  <created/> Time the record was created.
  <updated/> Time the record was last updated or modified.
</WorkscheduleWorkhour>
```

This datatype supports the read XML Commands.

**Workspace**

Use the Workspace datatype to specify workspace information.

```xml
<Workspace>
  <id/> Unique ID. Automatically assigned by the system.
  <name/> The workspace name.
  <description/> The description of the workspace.
  <date/> The date of the workspace.
  <userid/> The user id of the workspace owner.
  <notes/> Notes.
  <open/> A "1/0" field indicating whether this workspace is open.
  <allow_guests/> A "1/0" field indicating whether guests can be subscribed to this.
  <global/> A "1/0" field indicating if this is a global workspace (available to all users)
  <global_access/> The access permissions for all users:
          'R' - Read-only
          'W' - Read/write
          'A' - Administrator
  <created/> Time the record was created.
  <updated/> Time the record was last updated or modified.
</Workspace>
```

This datatype supports the read, add, and modify XML Commands.

**Workspacelink**

Use the Workspacelink datatype to specify workspace associations with other records.

```xml
<Workspacelink>
  <id/> Unique ID. Automatically assigned by the system.
  <created/> Time the record was created.
  <recordid/> The table ID the workspace is associated with.
  <url/> The URL of external link.
</Workspacelink>
```
Workspacelink

- `<external/>` A 1/0 field indicating if the record is an external link.
- `<updated/>` Time the record was last updated or modified.
- `<workspaceid/>` The ID of the associated workspace.

This datatype supports the read, add, and modify XML Commands.

Workspaceuser

Use the Workspaceuser datatype to specify workspace user permission information.

- `<Workspaceuser>`
  - `<id/>` Unique ID. Automatically assigned by the system.
  - `<created/>` Time the record was created.
  - `<userid/>` The ID of the associated user.
  - `<access/>` The access permissions for the user: R - Read-only, W - Read/write, or A - Administrator.
  - `<workspaceid/>` The ID of the associated workspace.
  - `<project_group_id/>` The ID of the project group if the user was assigned as part of a project group.
  - `<updated/>` Time the record was last updated or modified.

This datatype supports the read, add, and modify XML Commands.
Setting Application Switches Via the API

Certain Company and User switches can be set via the API. Switches are settings that customize the application. They do not affect actual record data.

Switches are set using the Flag XML datatype. Company and User datatypes have a `<flags/>` field that supports the Flag datatype and contains company and user switches and settings. These switch fields correspond to the switch fields in the User and Company tables in the OpenAir database.

Switches set at the Company level affect the entire company account. Switches set at the User level affect only a particular user.

The XML datatype structure for a switch is as follows:

```xml
<Company> (or <User>)
    <flags>
        <Flag>
            <name>X</name>
            <setting>X</setting>
        </Flag>
    </flags>
</Company> (or </User>)
```

where:

- `<name/>` is the name of the switch.
- `<setting/>` is the value to which it is set.
Customizing the Application

There are many options available that allow you to customize OpenAir to meet the needs of your company. You can access these options or switches using the XML API if the switch is enabled for either the account or the user. To obtain a list of switches supported by the system, please contact the OpenAir Support Department and open a support ticket. See Troubleshooting.

The switches determine the functionality, terminology, and appearance of the accounts in your offer code. For example, you could disable entire modules so that they are not visible in your accounts. Or, you could set an option for one particular user.

Keep in mind that these options or switches are specific to offer codes, not namespaces, and affect all accounts in an offer code. Your namespace may have one or more offer codes associated with it, depending on your particular setup. (See Connecting to the API.) If you have multiple namespace/key combinations, different accounts within the same namespace could have different settings if they are associated with different offer codes.

**Note:** These switches set default values for accounts in offer codes. Some, but not all, can be overridden on a per-account or per-user basis, meaning that account Administrators can change them. Feel free to contact the OpenAir Support Department or your account representative if you have any questions.

The following summarizes each of the Switch Groups in the OpenAir Switches Dictionary.

<table>
<thead>
<tr>
<th>Switch Group</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Approval Options</td>
<td>In this section, there is the option to enable the submit/approve process for Proposals and the project-level approvals for timesheets and expense reports for your entire namespace. All accounts in your namespace will have the submit/approve process enabled by default. Account Administrators can later disable these options for their particular accounts.</td>
</tr>
<tr>
<td>Batch Export Options</td>
<td>In this section, there are options that affect the data of batch export files. Export functionality is found on the My Account &gt; Exchange &gt; Import/ Export page.</td>
</tr>
<tr>
<td>Company-Specific Options</td>
<td>In this section, you will find switches created for very specific requirements.</td>
</tr>
<tr>
<td>Dashboard Options</td>
<td>In this section, there are display options for the My Account &gt; Dashboard tab. You can set the option to display dashboard items with values of zero as the default for all accounts in your namespace. For example, “No Open TimeBills” may display. This setting can be changed on a per-user basis as well. You can also set a default text message of your choice to be displayed on the Dashboard tab of all accounts. Account Administrators can change this message for their accounts.</td>
</tr>
<tr>
<td>Data Entry Options</td>
<td>In this section, there are options to enable the Accounting code and External ID fields on the New/Edit User form. In addition, you can limit the total size of all document attachments in the accounts in your namespace and the number of items displayed in the smart drop-down list boxes.</td>
</tr>
<tr>
<td>Display Options</td>
<td>In this section, there are display options for fields in the application.</td>
</tr>
<tr>
<td>Email Options</td>
<td>In this section, there are options to hide the default URLs that appear in approval notification emails for Expenses, Timesheets, and Proposals, and replace them with your own. There are also options to replace the default text.</td>
</tr>
<tr>
<td>Entity Creation</td>
<td>In this section, there are options that disallow the creation of certain account entities such as clients, users, services, and projects.</td>
</tr>
<tr>
<td>Switch Group</td>
<td>Description</td>
</tr>
<tr>
<td>------------------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Entity Deletion</td>
<td>In this section, there are options to disallow the deletion of certain account entities such as clients, users, services, and projects.</td>
</tr>
<tr>
<td>Entity Listing</td>
<td>In this section, there are options that hide account entities such as clients, users, services, and projects.</td>
</tr>
<tr>
<td>Entity Manipulation</td>
<td>In this section, there are options to disable the de-activation of certain account entities.</td>
</tr>
<tr>
<td>Expenses Options</td>
<td>In this section, there are options for envelopes. The option to disable the reimbursement feature can be re-enabled on a per-account basis, but only through the OpenAir Support Department or your account representative.</td>
</tr>
<tr>
<td>Feature Prevention — Account Creation</td>
<td>In this section, there are options to disable the automatic creation of certain default account items such as expense items and time types. If items are disabled, accounts might not have default expense items such as mileage, copies, or airfare.</td>
</tr>
<tr>
<td>Feature Prevention — Field Edit</td>
<td>In this section, there are options to hide various fields in the application, including certain tax-related, user-related, and company-related fields.</td>
</tr>
<tr>
<td>Feature Prevention — Tabs</td>
<td>In this section, there are options to hide various tabs (and therefore pages) in the application, as well as options to hide certain batch import/export links from the Exchange tab.</td>
</tr>
<tr>
<td>FilterSet Options</td>
<td>In this section, there are options to enable and require filter sets.</td>
</tr>
<tr>
<td>Guest Options</td>
<td>In this section, there are options to enable guest viewing for modules.</td>
</tr>
<tr>
<td>Invoices Options</td>
<td>In this section, there is an option that disables the payment feature for invoices if another accounting system is performing the function. The feature can be re-enabled on a per-account basis, but only through the OpenAir Support Department or your account representative. Other options include disabling certain editing and reporting functions.</td>
</tr>
<tr>
<td>Module Availability</td>
<td>In this section, there are options to disable certain import/export features and disable access to any of the modules in the application for all the accounts in your namespace.</td>
</tr>
<tr>
<td>Module Selections</td>
<td>In this section, there are options to disable access to any of the modules in the application for all accounts in your namespace. However, functionality remains for these options to be re-enabled on a per-account, per-role, or per-user basis.</td>
</tr>
<tr>
<td>OpenAir Billing</td>
<td>In this section, there is the option to hide the My Charges tab in the application for all accounts in your namespace.</td>
</tr>
<tr>
<td>Opportunities Options</td>
<td>In this section, there are options for the Opportunities module.</td>
</tr>
<tr>
<td>Optional Features</td>
<td>In this section, there are options to enable access to certain features for all accounts in your namespace, including the VAT feature and the Vehicle feature. The VAT feature setting can be changed on a per-account basis, but only by the OpenAir Support Department or your account representative. The Vehicle feature setting can be changed by account Administrators for their particular accounts.</td>
</tr>
<tr>
<td>Page Layout</td>
<td>In this section, there are options that determine the default appearance of the pages in the application for all accounts in your namespace. Several of the options have to do with the display of OpenAir and partner-specific logos and banners.</td>
</tr>
<tr>
<td>Password Options</td>
<td>In this section, there are password options.</td>
</tr>
<tr>
<td>Print Settings</td>
<td>In this section, there are default print settings for accounts in your namespace. For example, you can set PDF text format and page size (Letter, A4).</td>
</tr>
<tr>
<td>Projects Options</td>
<td>In this section, there are options for the Projects module.</td>

</tbody>
</table>
### Switch Group | Description
---|---
**Purchases Options** | In this section, there are purchases-related options such as user privileges for submitted and approved purchase requests and POs.

**Regional Settings** | In this section, there are options to set the default date format, currency, and number format for all accounts in your namespace. Account Administrators can change these settings in their particular accounts.

**Reporting Options** | In this section, there are options to hide personal information on reports, show projected billing, enable date and timestamp, enable date filters in various reports, hide the drill-down reports tab, disable FTE forecast summary report values, show internal ids on detail reports, and enable multi-currency reporting.

**Resources Options** | In this section, there are options for the Resources module such as email notifications of booking changes.

**Security Options** | In this section, there are options that set the amount of security used for pages in the application for all accounts in your namespace. There are options to determine the amount of SSL Encryption that will be used, to set a timeout for pages, and to disallow URL sharing. Account Administrators can change these settings in their particular accounts.

**Signers Options** | In this section, there is the option to enable the signers feature in the Expenses and Timesheets modules, as well as the option requiring that all sign-offs be complete before an expense report or timesheet can be approved. Account Administrators can change these settings in their accounts.

**Terminology** | In this section, there are options to set the default terminology to be used for all accounts in your namespace. Terminology for module and account entities can be changed. Account Administrators can change these default settings in their particular accounts.

**Time Settings** | In this section, there are options to set the defaults for several time settings including the time zone and whether Daylight Saving Time is being used. Account Administrators may change these settings for their particular accounts, and in the case of the time zone and Daylight Saving Time settings, also for particular users in their accounts.

**Timesheet Options** | In this section, you will find the option to enter default text that will appear on the Submit for approval page in the Timesheets module. This text is typically used for a legal disclaimer of some sort. You will also find the option to allow approvers to edit timesheets that have been submitted.

**User Proxying** | In this section, there are options to disable the proxy user feature for all accounts in your namespace. If this feature is disabled, the Account > Users [User ID] > Proxy link is not available.

**Vat Settings** | In this section, there is the option to set the default VAT rate for your all accounts in your namespace.

**Workspace Options** | In this section, there are options for certain elements within the Workspaces module.
Other Features

Other features that are helpful in using the XML API include limiting records returned with filters, hints, and the use of IDs.

Filters

There are several ways to filter the number of records you get back from a request. You can use an additional filter attribute when you make a Read command, you can use the user method of the Read command, use the project method of the Read command, or use the Filter datatype. Each is explained below.

Additional Filter Attribute with Read Command

**Example 1** — to return all tickets that are in open envelopes:

```
<Read type="Ticket" method="all" filter="open-envelopes"/>
```

**Example 2** — to return a list of all approved envelopes pending reimbursement:

```
<Read type="Envelope" method="equal to" filter="nonreimbursed-envelopes">
  <Envelope>
    <status>A</status>
  </Envelope>
</Read>
```

There are a variety of additional filters you can use to limit the number of records you get back from a request. Take a few minutes and review the Attributes listed under the Read, all command. Examples are also provided that use different methods and filter attributes.

Read, user Command

```
<Read obtype="ObjectName" method="user">
  <User>
    <id>X</id>
  </User>
</Read>
```

Returned: A list of "ObjectName" XML records that have a <userid> field equal to X (see above). Returns a failure message if "ObjectName" is a type that doesn't have a <userid> field.

Read, project Command

```
<Read type="datatype" method="project">
</Project>
```
Returned: A list of records that have a <projectid> field equal to X (see above). Make sure that the datatype used is a type that has a <projectid> field.

Filter datatype

Example —

```xml
<Filter type="customer">
  <id/> the customer ID
</Filter>
```

Currently, the only list that can be filtered with this datatype is the Customer list, using the type customer as an attribute of the <Filter/> datatype. The only Read method that is supported is Read, all.

Hints

Hints appear at the bottom of OpenAir application pages. To add hints to an application page, use the following html comment tags:

```
<!--BEGIN HINT --> The hint goes here. <!--END HINT -->
```

Note: Since this feature involves altering html pages, this is not a feature we generally recommend. Be cautious if you use it.

IDs

If you need to change (modify or delete) records in an account, you must make sure you user the record IDs in your request. If you do not have the IDs, you must first request the list of IDs that you need and then parse the XML for the records desired.

For example, in order to inactivate a user record, you can read all user records in order to obtain their IDs:

```xml
<Read type="User" method="all"/>
```

Then you can use the ID to inactivate a particular user record:

```xml
<Modify type="User">
  <User>
    <id>X</id>
    <active>0</active>
  </User>
</Modify>
```
Remaining Limit

A daily rate limit is enforced in the OpenAir XML API. See Limits for more information on the usage limits.

To find out your remaining daily rate limit you can make the following request:

```xml
<Read type="RateLimit" method="all" limit="1"/>
</Read>
```

You will receive a response similar to the following:

```xml
<Read status = "0">
<RateLimit><remain_24h_error>99949</remain_24h_error></RateLimit>
</Read>
```

In this example, 99949 is the remaining limit.

**Note:** Making this request will use up one from your daily limit.
Code Examples

Three levels of code examples are provided: basic, intermediate, and advanced.

Basic Example

Here is a basic example that will connect to the server using company name 'a', user name 'b' and password 'c'. It will then ask for the time and disconnect.

First we'll do it in the easier-to-read indented style:

```xml
<?xml version="1.0" encoding="UTF-8" standalone="yes"?>
<request API_ver="1.0" client="test app" client_ver="1.1" namespace="rightnamespace" key="0123456789">
  <Auth>
    <Login>
      <company>a</company>
      <user>b</user>
      <password>c</password>
    </Login>
  </Auth>
  <Time/>
</request>
```

Here is how it might look in an actual application:

```xml
<?xml version="1.0" encoding="UTF-8" standalone="yes"?><request API_version="1.0" client="test app"><request><Auth><Login><company>a</company><user>b</user> <password>c </password></Login></Auth><Time></Time> </request>
```

The server response would be:

```xml
<response>
  <Auth status="0"/>
  <Time status="0">
    <Date>
      <day>13</day>
      <month>02</month>
      <year>2000</year>
      <hour>23</hour>
      <minute>59</minute>
      <second>01</second>
    </Date>
  </Time>
</response>
```

Here is how it might look in an actual application:

```xml
<response><Auth status="0"/><Time status="0">Date<day>13</day><month>02</month><year>2000</year><hour>23</hour><minute>59</minute><second>01</second></Date></response>
```
Intermediate Example

For our intermediate example, we will fetch some actual information from the OA site. We will request 1000 Invoices in the system for this user starting at index 0. Subsequent requests can return more Invoices in the account. (The index value would need to be modified.)

Here is our request:

```xml
<?xml version="1.0" encoding="UTF-8" standalone="yes"?>
<request API_ver="1.0" client="test app" client_ver="1.1" namespace="rightnamespace" key="0123456789">
  <Auth>
    <Login>
      <company>a</company>
      <user>b</user>
      <password>c</password>
    </Login>
  </Auth>
  <Read type="Invoice" limit="0,1000" method="all"/>
</request>
```

Here is the response:

```xml
<response>
  <Auth status="0"/>
  <Read status="0">
    <Invoice>
      <id>1</id>
      <number>234</number>
      <customerid>204</customerid>
      <total>99.00</total>
      <tax>0.00</tax>
      <balance>80.00</balance>
      <draw>1</draw>
      <credit/>
      <credit_reason/>
      <terms/>
      <emailed>
        <Date>
          <day>13</day>
          <month>2</month>
          <year>2000</year>
        </Date>
      </emailed>
    </Invoice>
  </Invoice>
</response>
```
Advanced Example

This example (next two connects) shows a more useful example of the account creation and the API in general. We try to add a user to an account that doesn't exist, and then look up the error code returned.

Here is our request:

```xml
<?xml version="1.0" encoding="UTF-8" standalone="yes"?>
<request API_ver="1.0" client="test app" client_ver="1.1" namespace="rightnamespace" key="0123456789">
  <Auth>
    <user>admin user name</user>
    <company>barbaz</company>
    <password>mypassword</password>
  </Auth>
  <CreateUser>
    <Company>
      <nickname>barbaz</nickname>
    </Company>
    <User>
      <name>admin user name</name>
      <password>passwd</password>
      <taapprover>16</taapprover>
      <teapprover>16</teapprover>
      <addr>
        <Address>
          <first>Bah</first>
          <last>Foo</last>
          <phone>123-345-6789</phone>
        </Address>
      </addr>
    </User>
  </CreateUser>
</request>
```

Here is the response:

```xml
<response>
  <CreateUser status="201"/>
</response>
```
To find out what status 201 means, we reconnect.

Here is our request:

```
<request>
    <Read type="Error" method="equal to">
        <Error>
            <code>201</code>
        </Error>
    </Read>
</request>
```

Here is the response:

```
<response>
    <Read status="0">
        <Error>
            <code>201</code>
            <text>Company does not exist</text>
            <comment>Create the company first, then add the user</comment>
        </Error>
    </Read>
</response>
```
Appendix A Error Code Listing

The API returns error codes that you can use to help you identify problems with your operations. You can either refer to the tables that follow for specific Error Codes or, since an error is also a valid datatype in the XML data set, you can use the API to query the text translation. The response you receive depends on the type of error. Generally, you receive a response with a non-0 status code, which in some cases may also include the <errors> element that contains one or more textual error messages, concatenated in its inner text. See the Note under Parser Success with Failed Commands. Also see the datatype for Error and refer to the following Error Responses.

Error Responses

The following illustrates the error responses you may receive based on the XML request.

Parser Failure

If the XML request in its entirety is malformed and the parser on the server failed to load the request XML document, you will get the following response.

```xml
<response status="1">Badly formed XML, parsing aborted</response>
```

Parser Success with Validation Error on Request

If the XML request was parsed successfully, but there was a specific validation error on a specific request in the request stack, the response has the following structure. For more information, see the Code Examples chapter for Advanced Example.

```xml
<response>
  <Add status="1">An error description</Add>
</response>
```

Parser Success with Failed Commands

If you requested a stack of commands and some fail while others succeed, you will get a mixed response. The error description is either the body of the response or command element.

```xml
<response>
  <CreateUser status="201"/>
  <Add status="0">......data......</Add>
  <Add status="1">......data......</Add>
  ...
  etc.
  ...
</response>
```
**Note:** In some cases, in addition to the non-0 error code returned in a status attribute, there is an additional textual description of error(s) in the `<errors>` child node under the failed request element. See the example that follows.

```xml
<response>
  <Add status="123">
    <errors>Description of errors</errors>
  </Add>
</response>
```

**Error Codes**

Error codes are broken out by their type and you can search for one using the error code number. Refer to the following tables.

### Server Errors

<table>
<thead>
<tr>
<th>Error Code</th>
<th>Short Message</th>
<th>More Information</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>Success</td>
<td>The operation was successful</td>
</tr>
<tr>
<td>1</td>
<td>Unknown Error</td>
<td></td>
</tr>
<tr>
<td>2</td>
<td>not logged in</td>
<td>Command required a valid Auth, but Auth failed, or was left out of the request</td>
</tr>
<tr>
<td>3</td>
<td>too many arguments</td>
<td>More arguments (XML records) were passed to a command than the command accepts</td>
</tr>
<tr>
<td>4</td>
<td>too few arguments</td>
<td>Fewer arguments were passed to a command than were expected</td>
</tr>
<tr>
<td>5</td>
<td>Unknown Command</td>
<td>There is no command by that name, request failed</td>
</tr>
<tr>
<td>6</td>
<td>Access from an invalid URL</td>
<td>Please use the URL you were provided with to access the API</td>
</tr>
<tr>
<td>7</td>
<td>Invalid OffLine version</td>
<td>Please upgrade your version of OpenAir OffLine</td>
</tr>
<tr>
<td>8</td>
<td>Failure + Dynamic Message</td>
<td>The operation has failed, Please consult the Error record that was passed, this code is reserved for dynamically generated error codes</td>
</tr>
<tr>
<td>9</td>
<td>Logged out</td>
<td>Your session is no longer valid, please issue a login command</td>
</tr>
<tr>
<td>10</td>
<td>Invalid parameters</td>
<td>Invalid parameters were used, please consult documentation</td>
</tr>
</tbody>
</table>

### CreateUser Errors

<table>
<thead>
<tr>
<th>Error Code</th>
<th>Short Message</th>
<th>More Information</th>
</tr>
</thead>
<tbody>
<tr>
<td>201</td>
<td>invalid company</td>
<td>Create the company first, then create users</td>
</tr>
<tr>
<td>202</td>
<td>duplicate user nick</td>
<td>A user with this nickname already exists, try another one</td>
</tr>
<tr>
<td>203</td>
<td>too few arguments</td>
<td>You need to specify both a Company object and a User object</td>
</tr>
</tbody>
</table>
## Error Codes

<table>
<thead>
<tr>
<th>Error Code</th>
<th>Short Message</th>
<th>More Information</th>
</tr>
</thead>
<tbody>
<tr>
<td>204</td>
<td>Namespace error</td>
<td>Users must be created in the same namespace as the company</td>
</tr>
<tr>
<td>205</td>
<td>Workschedule error</td>
<td>Invalid account workschedule specified</td>
</tr>
</tbody>
</table>

### CreateAccount Errors

<table>
<thead>
<tr>
<th>Error Code</th>
<th>Short Message</th>
<th>More Information</th>
</tr>
</thead>
<tbody>
<tr>
<td>301</td>
<td>duplicate company nick</td>
<td>This company nick is already in use, try another one</td>
</tr>
<tr>
<td>302</td>
<td>too few arguments</td>
<td>You need to specify both a Company and User object</td>
</tr>
<tr>
<td>303</td>
<td>please pick a different password</td>
<td>The password entered was not hard enough to guess, please pick another to continue</td>
</tr>
<tr>
<td>304</td>
<td>Not enabled</td>
<td>CreateAccount operation is not permitted</td>
</tr>
</tbody>
</table>

### Auth Errors

<table>
<thead>
<tr>
<th>Error Code</th>
<th>Short Message</th>
<th>More Information</th>
</tr>
</thead>
<tbody>
<tr>
<td>401</td>
<td>Auth failed : No such company/user/</td>
<td>The combination of usernick/companynick/password doesn't exist</td>
</tr>
<tr>

</tbody>
</table>

### API Login Errors

<table>
<thead>
<tr>
<th>Error Code</th>
<th>Short Message</th>
<th>More Information</th>
</tr>
</thead>
<tbody>
<tr>
<td>501</td>
<td>API authentication required</td>
<td>API access must first be authenticated</td>
</tr>
<tr>
<td>502</td>
<td>API authentication failed</td>
<td>The request element must contain key &amp; name attributes</td>
</tr>
<tr>
<td>503</td>
<td>Invalid or missing key attribute</td>
<td>N/A</td>
</tr>
<tr>
<td>504</td>
<td>Invalid or missing namespace attribute</td>
<td>N/A</td>
</tr>
<tr>
<td>505</td>
<td>The namespace and key do not match</td>
<td>N/A</td>
</tr>
<tr>
<td>506</td>
<td>Authentication key disabled</td>
<td>This key has been disabled. Please contact support for more information</td>
</tr>
<tr>
<td>555</td>
<td>You have exceeded the limit set for the account for input objects</td>
<td>Please make sure to observe the limit for input data set for your account</td>
</tr>
<tr>
<td>556</td>
<td>XML API rate limit exceeded</td>
<td>The limit of requests allowed for your company has been reached.</td>
</tr>
</tbody>
</table>

### Read Errors

<table>
<thead>
<tr>
<th>Error Code</th>
<th>Short Message</th>
<th>More Information</th>
</tr>
</thead>
<tbody>
<tr>
<td>601</td>
<td>Invalid id/code</td>
<td>There isn't a record matching the id or code you asked for</td>
</tr>
<tr>
<td>602</td>
<td>Invalid field</td>
<td>N/A</td>
</tr>
<tr>
<td>603</td>
<td>Invalid type or method</td>
<td>N/A</td>
</tr>
<tr>
<td>604</td>
<td>Attachment size exceeds space available</td>
<td>Please contact your OpenAir administrator to request more space</td>
</tr>
<tr>
<td>605</td>
<td>Limit clause must be specified and be less than the account limit for output data</td>
<td>N/A</td>
</tr>
<tr>
<td>606</td>
<td>Projections are running, please try again in a few minutes.</td>
<td>N/A</td>
</tr>
</tbody>
</table>
Delete Errors

<table>
<thead>
<tr>
<th>Error Code</th>
<th>Short Message</th>
<th>More Information</th>
</tr>
</thead>
<tbody>
<tr>
<td>701</td>
<td>Cannot delete, failed dependency</td>
<td>You must first delete all the records that have an index pointing to this record</td>
</tr>
<tr>
<td></td>
<td>check</td>
<td></td>
</tr>
<tr>
<td>702</td>
<td>Invalid note</td>
<td>The note could not be deleted</td>
</tr>
</tbody>
</table>

Add/Modify Errors

<table>
<thead>
<tr>
<th>Error Code</th>
<th>Short Message</th>
<th>More Information</th>
</tr>
</thead>
<tbody>
<tr>
<td>801</td>
<td>Not a valid Customer ID</td>
<td>The Customer ID you tried to associate with this Project does not exist, or is deleted</td>
</tr>
<tr>
<td>802</td>
<td>This Envelope number is already taken</td>
<td>Please select a different Envelope number, or specify none for auto-numbering</td>
</tr>
<tr>
<td>803</td>
<td>This user does not have permission to modify the record</td>
<td>The non-administrative user is trying to modify an administrator only record</td>
</tr>
<tr>
<td>804</td>
<td>Not a valid Item type</td>
<td>The only valid types are R and M</td>
</tr>
<tr>
<td>805</td>

Appendix B Simple client (in perl)

This is an extremely simple client that will demonstrate a few basic exchanges to/from the API server. You must change the 'YOURNAME' text to the name of the subdomain you have been assigned (probably your company's name). This example requires the libwww-perl modules to run. They can be found at www.cpan.org if you don't have them already. This client does not use SSL and isn't robust enough for a production environment. SSL with perl is possible, but requires you install several other modules, and was not included for that reason.

Example:

```perl
#!/usr/bin/perl
use LWP::UserAgent;
use ::Request::Common;

$ua = new LWP::UserAgent;
$req = HTTP::Request->new( 'PUT' );
$req->url( 'https://my-account-domain.app.openair.com/api.pl' );
$content = '<xml version="1.0" encoding="UTF-8" standalone="yes">'.
          '<request API_version="1.0" client="test app" client_ver="1.1" namespace="yourco" key="0123456789">';
$json = prompt( "a) create new account
  "b) universal login
  "c) fetch an error code explanation\n" );

if ( $test ne 'a' && $test ne 'b' && $test ne 'c' ) {
  print "You entered $test, run me again and use a, b, or c\n";
  exit(0);
}
if ( $test eq 'c' ) {
  $code = prompt( "Enter the error code to look up\n" );
  $content .= "<Read type='Error' method='equal to'>".
            "<Error><code>$code</code></Error></Read></request>";
} elsif ( $test eq 'b' ) {
  $company = prompt( "Enter company nickname :\n" );
  $user = prompt( "Enter user nickname:\n" );
  $pass = prompt( "Enter password\n" );

  if ( $test eq 'a' ) {
    $email = prompt("Enter email address:\n" );

    $content .= "<CreateAccount>";
    $content .= "<Company><nickname>$company</nickname></Company>".
    "$<User><nickname>$user</nickname><password>$pass</password>".
    "<addr><Address><email>$email</email></Address></addr></User>";
    $content .= "</CreateAccount>";
  } elsif ( $test eq 'b' ) {
```
$content .= "<RemoteAuth>"
  "<Login><company>$company</company><user>$user</user><password>$pass</password></Login>"
</RemoteAuth>;

$content .= "</request>";

print "--- I'm going to send this to the server --\n";
print $content."
";
print "--- Here is the response ---\n";

$req->content( $content );
$response = $ua->request( $req );

if ( $response->is_success )
{
  print $response->content;
}
else
{
  print $response->status_line;
}

sub prompt {
  my $text = shift;
  print $text;
  my $answer = <>;
  chomp( $answer );
  return $answer;
}
Appendix C OpenAir Data Dictionary

The complete OpenAir Data Dictionary can be found at the following URL:
https://www.openair.com/database/single_user.html

The Customer Table is presented below to show how the XML datatype structure matches field names supported by the API. Each XML Datatype is comprised of field names and descriptions. Refer to XML Datatypes.

**Note:** An “X” in between XML tags shows where you would put the information itself. Remember, the XML datatypes are displayed in an indented style for readability. In your actual application, you would just use a continuous string without new lines or formatting.

### Customer Table

Appendix D Best Practices

Before you begin using OpenAir XML API functionality, ensure your OpenAir account is fully configured and in production. As you know, OpenAir provides a number of ways you can customize your company’s account to meet unique business requirements. While this flexibility allows you to maximize its effectiveness for your organization, it is helpful to establish the system before you try to access the tables and data fields within it.

Note: We highly recommend that you work with your OpenAir Professional Services (PS) consultant to design the API integration. The knowledge you gain about how tables and data fields are used in your business processes will save development time on the front end and help you optimize your integration on an ongoing basis.

Build the API Integration

The OpenAir XML API provides tools for building a powerful integration. Take some time to plan what you want to do, design your integration and document the process, develop your integration, and test it in your sandbox account, which provides you with a safe environment. Each step is explained in more detail in the following.

Step 1: Plan What You Want To Do

Think about what you are trying to achieve in your OpenAir implementation and how the XML API can increase your ability to do that. Ask and answer the following questions:

- What are your critical processes? How can the API integration help you streamline them?
- What are your repetitive tasks? How can the API integration help automate those tasks?
- What will the API integration be able to do that can help your employees save time?

Step 2: Design Your API Integration

Take time to develop a document that describes your API integration. Your PS consultant can expedite this effort and help reduce development time. Gain an understanding of what you are trying to achieve so that key players in your organization can provide valuable feedback before you begin the actual development.

Step 3: Develop Your Integration

Read this document in its entirety, talk with your PS consultant, and learn about the OpenAir data model and how it is used. Links to key information are provided in Introduction to OpenAir XML API.

- Develop the API integration with the help of your PS consultant. Incorporate labels and terms that will both reduce confusion and enhance the integration you develop.
- Test the API integration in your sandbox account. It is crucial that you use a non-production environment until you can be sure that the integration runs smoothly without error and does not corrupt vital production data.
Optimize the API Integration

The following suggestions will help you get the most out of your API integration. Discuss them with your PS consultant to ensure you understand why they improve the efficiency and effectiveness of your integration.

Make Batch Calls

When making calls in your API integration, request and update data records in batches. Typically, we recommend that records be grouped into batches of 500, but the specifics vary depending on the context and the expected volume of data to be transacted. Even when requesting data based on filtering criteria, multiple read operations can be specified within one read request. We recommend running batch operations during off-peak hours to minimize impact on integration performance.

Make Fewer Calls

Reducing the number of calls you make to the API improves the performance of your integration. Because API calls require a call/response over the public Internet, they can consume both time and resources. Minimizing the number of calls you make increases the speed at which your API integration operates. Running batch operations during off-peak hours also minimizes impact on performance.

While the API technically allows concurrent connections, running the API from multiple clients simultaneously is NOT recommended. This may cause performance deterioration due to contention on Web and database servers' resources and can affect the performance of both the API integration and user interaction.

Note: Please refer to the Limits section in Connecting to the API for more information regarding possible throttling controls. Batching multiple API operations into one request and caching data locally are the best methods to avoid our servers ever triggering throttling controls.

Cache Locally

Transactional records in OpenAir contain as many as a dozen foreign keys that refer to other records in the system. When retrieving a batch of transactional records, you will often be retrieving many records with the same foreign key value. For example, you could retrieve many charges with the same project_id or many timesheet entries with the same user_id.

To optimize performance, after retrieving a batch of charges, you should construct a message to retrieve all the project records associated with those charges and then hold those project records locally, either in memory or via persistent storage to use with the next batch. When you use a persistent cache, the integration could make sure it's up to date via use of our “newer-than” filters. We recommend getting list data, caching it, and then keeping it in sync by requesting records that have changed since the previous update. OpenAir Web Services also allows you to request deleted data since the last request, which is another way to ensure your local list data cache is up-to-date.

Another way of optimizing performance is paying attention to the range of possible foreign key values for an attribute. This range of values could be very small. For example, even a very large OpenAir account may have only 3 or 4 timetypes and every time entry record will then have one of those 3 or 4 values. Once the timetype records have been retrieved, they can be held locally for an indefinite period as timetype values change infrequently and the same small set can be referenced on every time entry transaction.
Optimize the API Integration

Use Date Filters to Limit Amount of Data Processed

Make sure you are only requesting data that is new, modified, or deleted. When requesting list elements like projects, as mentioned previously, we recommend that you keep a local cache of records. See Cache Locally. Issuing a read command that requests records that have been added/modified and/or deleted since the previous integration run allows the integration logic to process only a small data set of changed records. By default, the "newer-than" filter uses the 'updated' date on each record, which is the timestamp appropriate for such use. For a code example, see code Example 5 in Read, all for code to request records that are newer than a specified date.

Use not-exported Filters to Limit Amount of Data Processed

Make sure you are only requesting data that has not previously been exported. For transactional exports, we recommend exporting approved entries and then marking these records in the OpenAir system as having been exported. You can configure OpenAir to lock exported data so that it cannot be modified after the export. You can also configure OpenAir reports and lists to show records as having been exported to another system. Export child elements and mark these child elements as being exported. For example:

- Use the not-exported filter when you export Invoices and their Slips. Since slip records are the list/child element of an Invoice, you can mark each individual Slip record as being exported. Subsequent integration runs issue a read request and the "not-exported" attribute/filter only returns qualifying transactions, i.e., transactions not previously processed.
- Use the not-exported filter to export Task records for timesheet information.
- Use the not-exported filter to export Ticket records for export expense information.

See code Read, all in Read, all for code to request not-yet exported records, filter by not-exported, as well as code to mark returned Slip records as being exported.

Maintain the API Integration

Before you use your API integration, there are two additional tasks to perform: set up the storage of communication logs and determine a process for upgrading the OpenAir system. Each is explained as follows.

Store Communication Logs

In the event of an API integration error, your PS consultant or OpenAir Support can help you troubleshoot the error. To do so, you need to be able to provide them with both the request code and associated response. Store a log of recent API communications as well as the exact timestamps of API requests to OpenAir servers. We recommend that you create a communication log that stores a minimum of the last seven days transactions. See Troubleshooting for information on getting help from OpenAir Support.

Upgrade With Caution

Once your API integration is tested and you move it into production, you need to determine a process for upgrading or making changes to the OpenAir system. We recommend that you do not make changes to
the OpenAir production system before testing them in your sandbox account against the API integration. In particular, use care when you need to modify an object or application setting related to data or functionality that is tied to your API integration. Always test changes in your sandbox account prior to implementing them in the production system.
Troubleshooting

If you are experiencing difficulties or would like additional information, please create a support case and submit it through your OpenAir account. Use a support ticket to request API access.

To create a support case:

1. Log in to your OpenAir account and select **Support** from the User Center menu.
2. Click on the **Go to SuiteAnswers** button.
3. From the **SuiteAnswers** site home page, click **Contact Support Online**.
4. Enter your question keywords and click **Search**.

**Note:** If you do not have a question, i.e. you need a switch enabled, just click Search.

5. Very often the answer to your question will be displayed. If you still want to create a support case click **Continue to Create Case**.
6. Fill out the **Create Case** form and then click the **Submit**. You will receive an email confirmation with **Your OpenAir Customer Care #**.

**Note:** An asterisk * displays after required fields.

Our support staff and engineers will work with you to find a solution to your problem.
New Features

October 12, 2019

The following datatypes and fields were exposed:

<table>
<thead>
<tr>
<th>Datatype</th>
<th>Fields Exposed</th>
</tr>
</thead>
<tbody>
<tr>
<td>ProjectTaskAssign</td>
<td>rule_rate_override, rule_rate_override_currency</td>
</tr>
<tr>
<td>WorkscheduleWorkhour</td>
<td>id, workscheduleid, workday, workhours, created, updated</td>
</tr>
<tr>
<td>Timesheet</td>
<td>min_hours, max_hours</td>
</tr>
<tr>
<td>ProjectBillingRule</td>
<td>extra_data</td>
</tr>
</tbody>
</table>

- Added support for returning the “minimum” and “maximum number of hours required on the timesheet” in the Timesheet datatype as determined by Timesheet rules. This includes:
  - Added calculated Fields `<min_hours>` and `<max_hours>` to Timesheet datatype.
  - Added attribute `calculate_hours` to the Read XML command.
- Added support for the Delete (id) command to the Uprate datatype.

Features for April 13, 2019

The following datatypes and fields were exposed:

<table>
<thead>
<tr>
<th>Datatype</th>
<th>Fields Exposed</th>
</tr>
</thead>
<tbody>
<tr>
<td>Notes</td>
<td>id, created, updated</td>
</tr>
<tr>
<td>NewsfeedMessage</td>
<td>id, newsfeedid, title, content, tagid, created, authorid, updated, editorid</td>
</tr>
<tr>
<td>Project</td>
<td>newsfeedid</td>
</tr>
<tr>
<td>ProjectBillingTransaction</td>
<td>currency</td>
</tr>
</tbody>
</table>

- Added Administration > Global Settings > API Limits screen. See Managing Your Account Frequency Limits.

Features for October 13, 2018

Bookings are now supported for the submit, reject, approve, and unapprove XML Commands.

The following datatypes and fields were exposed:

<table>
<thead>
<tr>
<th>Datatype</th>
<th>Fields Exposed</th>
</tr>
</thead>
<tbody>
<tr>
<td>Task</td>
<td>start_time, end_time</td>
</tr>
</tbody>
</table>
Features for October 13, 2018

- Error codes and related information was added for error codes 1404, 1405, 1406 and 1407.

Features for April 14, 2018

The following datatypes and fields were exposed:

<table>
<thead>
<tr>
<th>Datatype</th>
<th>Fields Exposed</th>
</tr>
</thead>
<tbody>
<tr>
<td>ProjectBudgetGroup</td>
<td>etc, etc_labor, etc_expense, etc_purchase, eac, eac_labor, eac_expense, eac_purchase, itd, itd_labor, itd_expense, itd_purchase</td>
</tr>
</tbody>
</table>

Features for October 14, 2017

- Added ModifyOnCondition.
- Added order attribute to Read command.

The following datatypes and fields were exposed:

<table>
<thead>
<tr>
<th>Datatype</th>
<th>Fields Exposed</th>
</tr>
</thead>
<tbody>
<tr>
<td>Proxy</td>
<td>id, user_id, proxy_id, own, role_id, expiration, created, updated</td>
</tr>
<tr>
<td>Resourceprofile_type</td>
<td>id, name, description, type, related_table, related_id, active, external_id, created, updated</td>
</tr>
<tr>
<td>ResourceAttachment</td>
<td>id, userid, attachment_id, type, latest_attachment_id, created, updated</td>
</tr>
<tr>
<td>User</td>
<td>cv_attachment_id</td>
</tr>
<tr>
<td>AccountingPeriod</td>
<td>id, name, start_date, end_date, period_date_how, period_date, current_period, default_period, notes, active, created, updated</td>
</tr>
</tbody>
</table>

- Error codes and related information was added for error codes 960, 961, 962, 963, and 964.

Features for April 15, 2017

- Enabled delete support for Category_1. (interim change)
- Enabled delete support for Category_2. (interim change)
- Enabled delete support for Category_3. (interim change)
- Enabled delete support for Category_4. (interim change)
- Enabled delete support for Category_5. (interim change)
- Enabled delete support for Costcenter. (interim change)
- Enabled delete support for Request_item. (interim change)

The following datatypes and fields were exposed:
Features for April 15, 2017

- Error codes and related information was added for Add/Modify error codes 899, 900, 947, 948, 949, 950, and 951.
- Added note to clarify that `limit` attribute limits projects rather than project tasks when using `read` method with `projecttask` datatype. See `Projecttask`.
- Added note to clarify `Task loaded_cost` and `project loaded_cost` default functionality, and corrected their descriptions.

Features for October 15, 2016

- Added `Unapprove` support for Envelopes, Invoices, and Timesheets.
- Error code and related information was added for Project Budget error codes 945 and 946. See `Error Codes`.

Expose Datatypes and Fields

The following datatypes and fields were exposed:

<table>
<thead>
<tr>
<th>Datatype</th>
<th>Fields Exposed</th>
</tr>
</thead>
<tbody>
<tr>
<td>Purchase_item</td>
<td>project_taskid</td>
</tr>
<tr>
<td>Project</td>
<td>main_contactid</td>
</tr>
<tr>
<td>ExpensePolicy</td>
<td>id, customerid, projectid, description, deleted, created, updated, audit, all_items_allowed</td>
</tr>
<tr>
<td>ExpensePolicyItem</td>
<td>id, expense_policyid, itemid, price_max, price_fixed, currency, deleted, created, updated, audit</td>
</tr>
<tr>
<td>AttributeDescription</td>
<td>id, resourceprofile_typeid, attributeid, description, deleted, created, updated, audit</td>
</tr>
<tr>
<td>Attachment</td>
<td>size</td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
</tbody>
</table>
Features for April 16, 2016

- It is no longer possible to rename, change, or delete a custom field which is being used by an active script. This prevents unintended script problems.

Features for October 17, 2015

- Error code and related information was added for MakeURL error code 943. Project names must be unique by customer.

Expose Datatypes and Fields

The following fields were exposed.

<table>
<thead>
<tr>
<th>Datatype</th>
<th>Fields Exposed</th>
</tr>
</thead>
<tbody>
<tr>
<td>Paymenttype</td>
<td>default_status, default_payment_type</td>
</tr>
<tr>
<td>Slip</td>
<td>skip_recognition</td>
</tr>
</tbody>
</table>

Changes to Existing Functionality

Approve, Reject, and Submit commands can now be performed for Invoices.

Features for April 18, 2015

The following datatypes were added: Booking_request

Expose Datatypes and Fields

The following fields were exposed.

<table>
<thead>
<tr>
<th>Datatype</th>
<th>Fields Exposed</th>
</tr>
</thead>
<tbody>
<tr>
<td>Project</td>
<td>rate_cardid</td>
</tr>
<tr>
<td>Agreement, BookingType, Category, Category_1, Category_2, Category_3, Category_4, Category_5, Contact, Costcenter, Customer, Customerpo, Department, Item, Payroltype, Project, Projectstage, Projecttask_type, Timetype, User, Vendor</td>
<td>picklist_label</td>
</tr>
</tbody>
</table>

Features for October 18, 2014

The following datatypes were added: ItemToUserLocation and UserLocation.
Expose Datatypes and Fields

The following fields were exposed.

<table>
<thead>
<tr>
<th>Datatype</th>
<th>Fields Exposed</th>
</tr>
</thead>
<tbody>
<tr>
<td>Booking</td>
<td>source_booking_id</td>
</tr>
<tr>
<td>Projectbillingrule</td>
<td>assigned_user</td>
</tr>
<tr>
<td>Ticket</td>
<td>user_locationid</td>
</tr>
</tbody>
</table>

Features for May 17, 2014

The following datatypes were added: ResourceRequest, ResourceRequestQueue, ResourceSearch, Workspace.

Expose Datatypes and Fields

The following fields were exposed.

<table>
<thead>
<tr>
<th>Datatype</th>
<th>Fields Exposed</th>
</tr>
</thead>
<tbody>
<tr>
<td>Attachment</td>
<td>ownerid, is_a_folder, owner_type, name</td>
</tr>
</tbody>
</table>

Features for February 15, 2014

The following datatypes were added: ResourceRequest, ResourceRequestQueue, ResourceSearch, Workspace.

Expose Datatypes and Fields

The following fields were exposed.

<table>
<thead>
<tr>
<th>Datatype</th>
<th>Fields Exposed</th>
</tr>
</thead>
<tbody>
<tr>
<td>Address</td>
<td>contact_id</td>
</tr>
</tbody>
</table>

Features for November 16, 2013

- The following datatype was added: BillingSplit

Expose Datatypes and Fields

The following fields were exposed.
Features for November 16, 2013

<table>
<thead>
<tr>
<th>Datatype</th>
<th>Fields Exposed</th>
</tr>
</thead>
<tbody>
<tr>
<td>Approvalprocess</td>
<td>externalid</td>
</tr>
<tr>
<td>LoadedCost</td>
<td>externalid</td>
</tr>
<tr>
<td>BookingByDay</td>

</tr>
<tr>
<td>Contact</td>
<td>userid, audit</td>
</tr>
</tbody>
</table>

Features for August 17, 2013

- Added restriction on reading RevenueProjection. This datatype cannot be read while projections are running. Added error code 606 to report this condition.
- Added PendingBooking and ProjectAssignmentProfile datatypes.

Expose Datatypes and Fields

The following fields were exposed.

<table>
<thead>
<tr>
<th>Datatype</th>
<th>Fields Exposed</th>
</tr>
</thead>
<tbody>
<tr>
<td>Projectassign</td>
<td>project_assignment_profile_id, pending_booking_id, booking_id</td>
</tr>
<tr>
<td>Booking</td>
<td>project_assignment_profile_id</td>
</tr>
<tr>
<td>User</td>
<td>rm_approver, rm_approvalprocess</td>
</tr>
<tr>
<td>Project</td>
<td>rm_approver, rm_approvalprocess</td>
</tr>
</tbody>
</table>

Features for May 18, 2013

- The following datatypes were added: BookingByDay and RevenueProjection.
- Added ability to determine Remaining Limit.

Expose Datatypes and Fields

The following fields were exposed.
Features for March 16, 2013

Expose Datatypes and Fields
The following fields were exposed.

<table>
<thead>
<tr>
<th>Datatype</th>
<th>Fields Exposed</th>
</tr>
</thead>
<tbody>
<tr>
<td>Projectbillingtransaction</td>
<td>slip_stage_id</td>
</tr>
<tr>
<td>Slip</td>
<td>originating_id</td>
</tr>
</tbody>
</table>

Features for January 19, 2013

- Custom fields associated with Budget may be requested using the Read, custom equal to command.

Features for November 17, 2012

- Provide support for "Require use of expense type price on receipts" option for Android devices.

Expose Datatypes and Fields
The following fields were exposed.

<table>
<thead>
<tr>
<th>Datatype</th>
<th>Fields Exposed</th>
</tr>
</thead>
<tbody>
<tr>
<td>Item</td>
<td>cost_is_fixed</td>
</tr>
</tbody>
</table>

Features for July 14, 2012

- Allow the setting of the "Notify requester when booking is modified" field on the booking form through SOAP API.
- Added error code and related information to Add/Modify error code 885. Force error on bad date in Purchase item import. Mandatory date is missing in purchase item.

Expose Datatypes and Fields
The following fields were exposed.
### Features for May 12, 2012

- Expanded the definition of the `limit` attribute on the `Read` command.
- Added a reference for an internal switch to `ForexInput`. You can have an internal switch enabled in your account for user defined reporting currencies.

### Expose Datatypes and Fields

The following fields were exposed.

<table>
<thead>
<tr>
<th>Datatype</th>
<th>Fields Exposed</th>
</tr>
</thead>
<tbody>
<tr>
<td>Project</td>
<td>portfolio_projectid, is_portfolio_project</td>
</tr>
</tbody>
</table>

### Features for March 17, 2012

- Add or modify custom fields inline in a single request with other native fields. To enable this behavior, supply the “enable_custom” attribute in your add or modify request and set it to 1. See Reading Custom Field Values Inline with Native Fields and Adding/Modifying Records with Inline Custom Field Values.
- Added a “generic” attribute for read commands. By default, the API returns regular users. When you add the generic attribute, the read request returns generic users.
- Added references for internal switches that affect the behavior of the API for the following complex types: `Envelope`, `Invoice`, `Purchase_item`, `Slip`, `Ticket`, and `Timesheet`.
- Error code and related information was added for Custom Field error code 1106. One or more inline custom fields failed to be updated.
- Error code and related information was added for MakeURL error code 941. Reject User add/modify requests that contain invalid time zone identifiers.
- Added clarifying information to Add/Modify error code 821. While it is returned when a timesheet cannot be modified because it was already submitted, it is also returned when other conditions exist. See `Timesheet`.

### Expose Datatypes and Fields

The following fields were exposed.

<table>
<thead>
<tr>
<th>Datatype</th>
<th>Fields Exposed</th>
</tr>
</thead>
<tbody>
<tr>
<td>Booking</td>
<td>notify_owner</td>
</tr>
<tr>
<td>Projectbillingrule</td>
<td>exclude_non_billable_task</td>
</tr>
<tr>
<td>Revenue_recognition_transaction</td>
<td>portfolio_projectid</td>
</tr>
<tr>
<td>Slip</td>
<td>portfolio_projectid</td>
</tr>
</tbody>
</table>
Features for January 21, 2012

- The following datatype was added: Schedulebyday. Custom fields associated with Schedulebyday may be requested using the Read, custom equal to command.
- Custom fields associated with Purchaseorder may now also be requested using the Read, custom equal to command.
- Custom fields associated with Request_item may now also be requested using the Read, custom equal to command.

Expose Datatypes and Fields

The following fields were exposed.

<table>
<thead>
<tr>
<th>Datatype</th>
<th>Fields Exposed</th>
</tr>
</thead>
<tbody>
<tr>
<td>Schedulebyday</td>
<td>id, date, user_id, hours, base_hours, target_hours, target_base_hours, created, updated</td>
</tr>
</tbody>
</table>

Features for November 19, 2011

- The following datatype was added: RevenueStage

Expose Datatypes and Fields

The following fields were exposed.

<table>
<thead>
<tr>
<th>Datatype</th>
<th>Fields Exposed</th>
</tr>
</thead>
<tbody>
<tr>
<td>Booking</td>
<td>locationid</td>
</tr>
<tr>
<td>RevenueStage</td>
<td>id, name, revenue_stage_type, created, updated</td>
</tr>
<tr>
<td>Revenue_recognition_transaction</td>
<td>is_from_open_stage</td>
</tr>
</tbody>
</table>

Features for September 17, 2011

- Added an Error Responses section to Appendix A Error Code Listing. It includes errors you may receive for XML requests when there is Parser Failure, Parser Success with Validation Error on Request, and Parser Success with Failed Commands.
- The following datatype was added: UserWorkSchedule.
- XML API handles all existing task rounding rules.
- Error code and related information was added for Add/Modify error code 882.
Expose Datatypes and Fields

The following fields were exposed.

<table>
<thead>
<tr>
<th>Datatype</th>
<th>Fields Exposed</th>
</tr>
</thead>
<tbody>
<tr>
<td>Invoice</td>
<td>credit_rebill_status, original_invoiceid</td>
</tr>
<tr>
<td>Project</td>
<td>rv_approver, rv_approvalprocess</td>
</tr>
<tr>
<td>Projectbillingrule</td>
<td>category_1id, category_2id, category_3id, category_4id, category_5id</td>
</tr>
<tr>
<td>RevenueContainer</td>
<td>project_billing_rule_filter, category_1id, category_2id, category_3id, category_4id, category_5id</td>
</tr>
<tr>
<td>Revenue_recognition_rule_amount</td>
<td>category_1id, category_2id, category_3id, category_4id, category_5id</td>
</tr>
<tr>
<td>Slip</td>
<td>ref_slipid</td>
</tr>
<tr>
<td>TaskTimecard</td>
<td>category_1id, category_2id, category_3id, category_4id, category_5id</td>
</tr>
<tr>
<td>UserWorkschedule</td>
<td>id, name, userid, use_this_schedule, account_workscheduleid, workdays, workhours, created, updated</td>
</tr>
</tbody>
</table>

⚠️ Important: New Features for July 16, 2011

- The following arguments /options were added to the MakeURL command: view-invoice, dashboard-project, grid-timesheet, report-timesheet.
- Custom fields associated with Payment may now also be requested using the Read, custom equal to command.
- Custom fields associated with User may now be returned for regular as well as generic users.
- Error code and related information was added for API Login error code 556.

Features for May 14, 2011

- The following datatype was added: RevenueContainer. Enabled support for read including CustField and update of externalid only.
- API will not allow negative quantity on non-PO purchase items.
- Fixed an issue where email field was reset on Contact update when value was not provided.
- Added parentid field to Attachment.
- Error codes and related information were added for Add/Modify error codes 880 and 881.

Expose Datatypes and Fields

The following fields were exposed.

<table>
<thead>
<tr>
<th>Datatype</th>
<th>Fields Exposed</th>
</tr>
</thead>
<tbody>
<tr>
<td>Attachment</td>
<td>parentid</td>
</tr>
</tbody>
</table>
Features for March 19, 2011

- TargetUtilization records can now be added for inactive users.
- When a new customer or client is created and payment terms are not explicitly specified, default payment terms are used.
- Job_codeid can have a value of 0 in modify operations on Projectassign and Projecttaskassign.
- Short PO Purchase_item import sets the date on fulfillments to date_fulfilled (if present) or to today's date.
- Error codes and related information were added for API Login error code 555 and MakeURL error codes 914 - 915

Expose Datatypes and Fields

The following fields were exposed.

<table>
<thead>
<tr>
<th>Datatype</th>
<th>Fields Exposed</th>
</tr>
</thead>
<tbody>
<tr>
<td>CustField</td>
<td>never_copy</td>
</tr>
<tr>
<td>Task</td>
<td>category_1id, category_2id, category_3id, category_4id, category_5id</td>
</tr>
</tbody>
</table>

Features for January 22, 2011

- Enabled custom equal to support for Paymenttype.
- Enabled modify and delete support for Attachment.
- Enabled delete support for Booking.
- Error codes and related information were added for Add/Modify error codes 878 - 879 and Custom Field error code 1105.

Expose Datatypes and Fields

The following fields were exposed.

<table>
<thead>
<tr>
<th>Datatype</th>
<th>Fields Exposed</th>
</tr>
</thead>
<tbody>
<tr>
<td>Revenue_recognition_rule_amount</td>
<td>cost_center_id</td>
</tr>
</tbody>

Features for January 22, 2011

<table>
<thead>
<tr>
<th>Datatype</th>
<th>Fields Exposed</th>
</tr>
</thead>
<tbody>
<tr>
<td>Task</td>
<td>acct_date</td>
</tr>
<tr>
<td>Ticket</td>
<td>externalid</td>
</tr>
<tr>
<td>Timesheet</td>
<td>acct_date</td>
</tr>
</tbody>
</table>

Features for November 20, 2010

- The following datatype was added: Projectgroup.
- Enabled add, modify, and delete support for Agreement_to_project.
- Enabled delete support for Entitytag.
- Error codes and related information were added for Add/Modify error codes 876 - 877, Make URL error codes 936 - 938, and Custom Field error code 1104.

Expose Datatypes and Fields

The following fields were exposed.

<table>
<thead>
<tr>

<td>cost_centerid</td>
</tr>
<tr>
<td>Ticket</td>
<td>attachmentid, currency_exchange_intolerance</td>
</tr>
</tbody>
</table>

Features for January 23, 2010

  - email_report: when equal to 1, a report executes and sends an email with a PDF attachment to the session user.
  - relatedid for type ="Report". ID of a saved report.
  - relatedid for type ="Timesheet". ID of a timesheet.
- relatedid for type ="Envelope". ID of an envelope.

### Programming Fixes, Checks, and Validations
- Enabled read support for Report.
- Enabled modify and add support for Hierarchy.
- Enabled modify, add, and delete support for HierarchyNode.
- Fixed issue where user workschedule was not being set when user is created through XML.
- Fixed the logic that requests deleted records, applying the not-exported filter against a deleted import_export record.
- Changed the way we handle invalid utf8 characters: strip them out completely instead of converting them to decimal numbers. Removed more utf8 encoding errors in the server log for accounts not configured for utf8.
- Adjusted CreatorUser logic to more closely follow UI logic when setting user.name field.

---

### Expose Datatypes and Fields

The following fields were exposed.

<table>
<thead>
<tr>
<th>Datatype</th>
<th>Fields Exposed</th>
</tr>
</thead>
<tbody>
<tr>
<td>Booking</td>
<td>owner_id</td>
</tr>
<tr>
<td>Company</td>
<td>workscheduleid (read-only field)</td>
</tr>
<tr>
<td>Hierarchy</td>
<td>externalid</td>
</tr>
<tr>
<td>HierarchyNode</td>
<td>available_as_column, externalid, primary_dropdown_filter, primary_user_filterset</td>
</tr>
<tr>
<td>Report</td>
<td>id, userid, name, type, thin_client_context, date_created, email_report, relatedid, created, updated</td>
</tr>
</tbody>
</table>

---

### Features for November 21, 2009

- Set User Workschedule - Added the ability to set the user workschedule via the User datatype or during user account creation. See [Set User Workschedule](#).

---

### Expose Datatypes and Fields

The following fields were exposed.
